# How does a laser-wire work?

- When the photons of a laser interact with electrons, **Compton photons are produced**.
  - The number of Compton photons produced is **proportional** to the electrons' density at the position of the laser.
  - By sweeping a laser across an electron beam one can produce a **profile of the beam** and hence measure its size.
  - Knowing the size of a beam allow to measure its **emittance**.
- The resolution of a laser-wire depends on the **size of the laser** beam

# Laser-wire R&D for the ILC

- Many (~70) laser-wires will be used along the ILC to control the emittance from the source to the Interaction Point.
- Important R&D is needed to demonstrate laser-wire operations in ILC-like conditions: ultra fast scanning, strong focusing, high power high rep. rate low  $M^2$  laser
- 2 single-pass prototypes in operation:
  - One at PETRA (DESY): fast scanning, 2D...
  - One at the ATF (KEK): um-resolution
- Other LW applications are investigated by other groups (DR LW,...)

# 2D LW scanner at PETRA

Post IP Imaging System  
aligned for both dimensions  
for real time laser size monitoring

Free space Beam Transport (~ 30m)

2D scan  
through automatic  
path selection

Scanning device:  
Piezo-mirror  
max speed 100 Hz

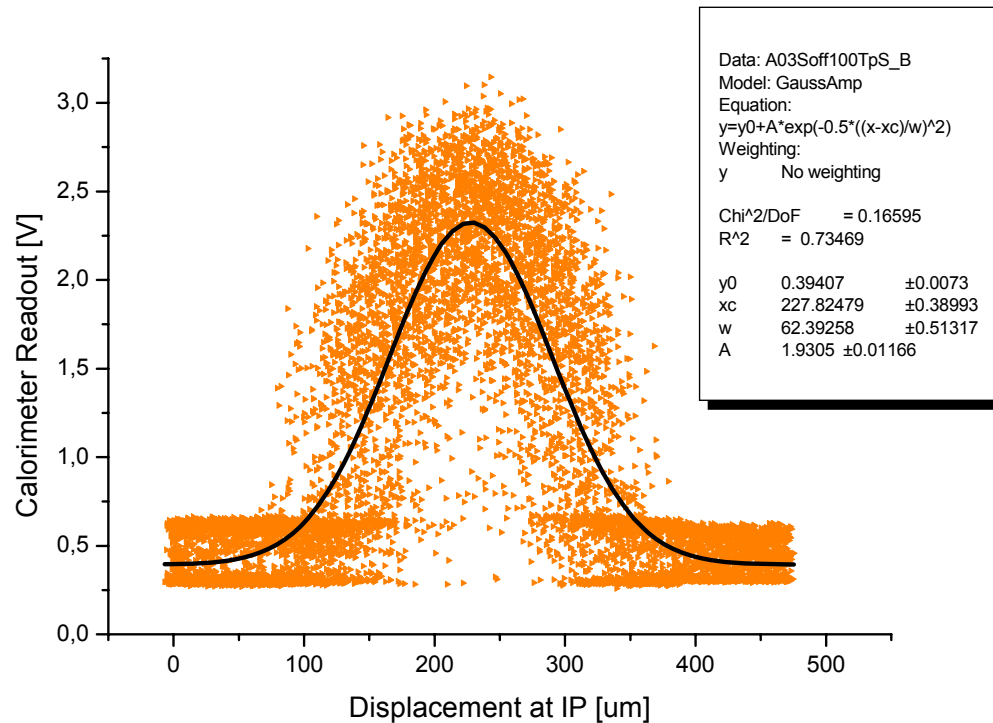

Automatic beam finding  
Translation stages

Laser  
rep rate = 20 Hz  
pulse width 6 ns

Laser spot-size ~ 12  $\mu\text{m}$

Unseeded (100 steps, 100 points per step) 10,000/20Hz = 500sec

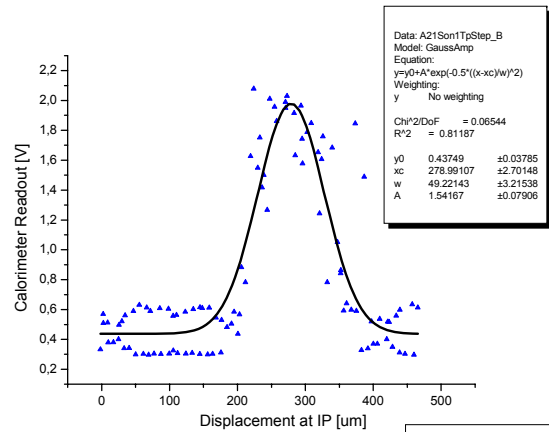

Sigma ~ 62um

Seeded (100 steps, 100 points per step) 10,000/20Hz = 500sec

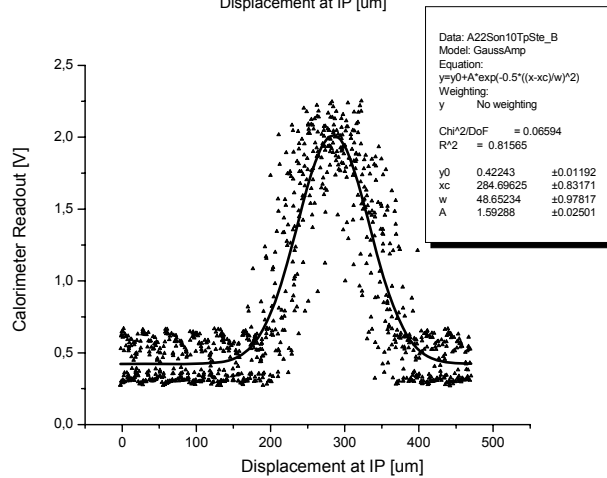

Sigma ~ 46um

Scan give a better resolution when the laser is seeded.

Seeded (100 steps, 1 point per step)  
 $100/20\text{Hz} = 5 \text{ sec}$

Sigma ~ 49um

Seeded (100 steps, 10 points per step)  
 $1,000/20\text{Hz} = 50\text{sec}$

Sigma ~ 49um

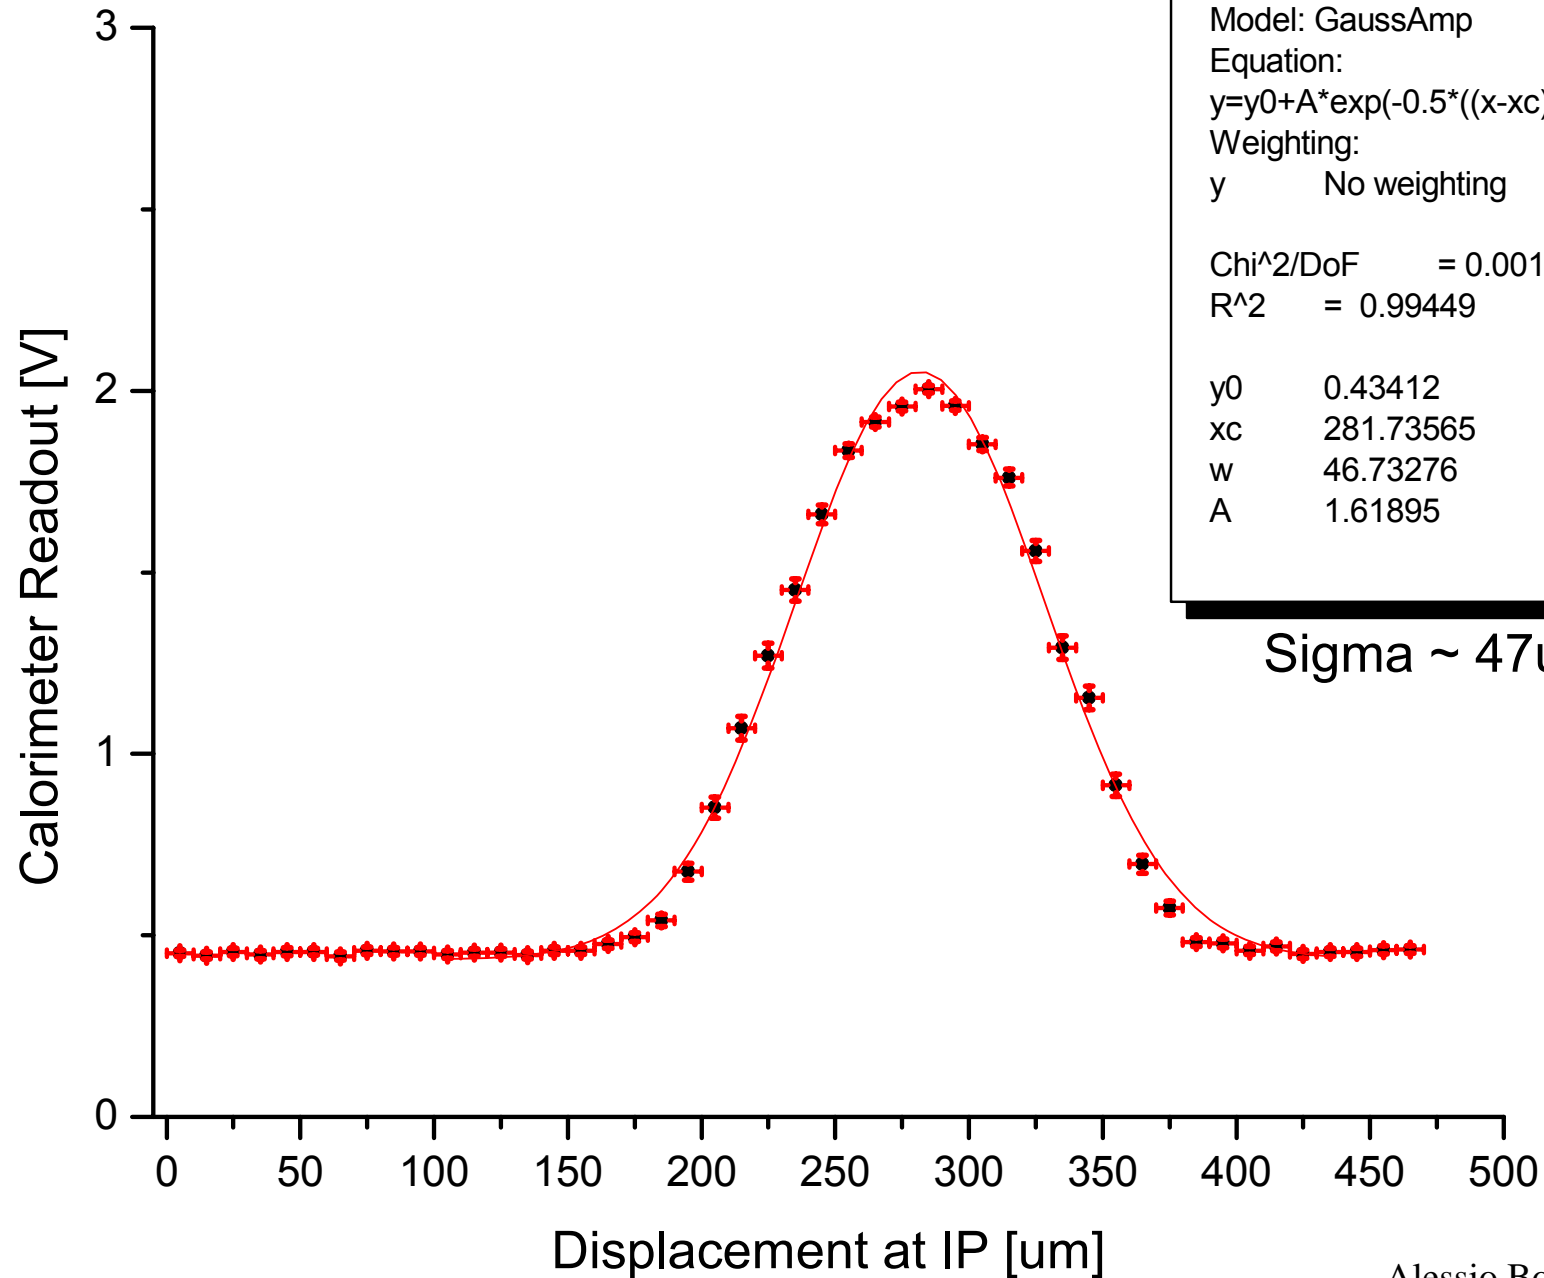

Seeded (100 steps, 100 points per step)  
 $10,000/20\text{Hz} = 500\text{sec}$

Sigma ~ 47um

Fast scans give a resolution comparable to scans  
 with more data points

Seeded (100 steps, 100 points per step) 10,000/20Hz = 500sec  
Averaged step-by-step

Data: T100Profile\_B  
Model: GaussAmp  
Equation:  
 $y=y_0+A*\exp(-0.5*((x-x_c)/w)^2)$   
Weighting:  
y No weighting

Chi^2/DoF = 0.00181  
R^2 = 0.99449

Sigma ~ 47um

# ATF Extraction line laser-wire

- Goal: demonstrate um-scale resolution in a single pass system
- System successfully installed and tested last year with a commercial lens
- Strong focusing lens will be installed this year

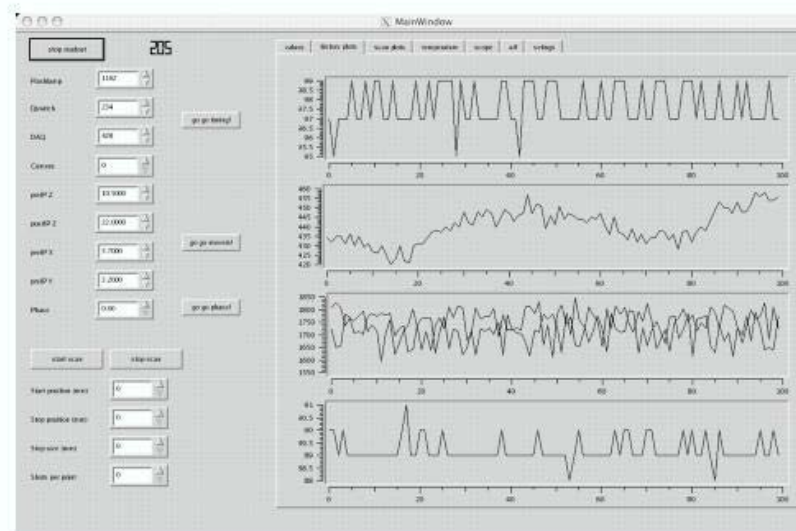

# ATF LW data (spring 2006)

- Obtaining Compton photons at the LW IP is a 2D problem: photons and electrons must overlap in time (within 200ps) and space (vertically, within 20um)
- First collisions observed in April 2006.
- Measured beam size compatible with our expectations.
- Scan asymmetry due to lens aberrations
- Laser  $M^2 \sim 2.9$

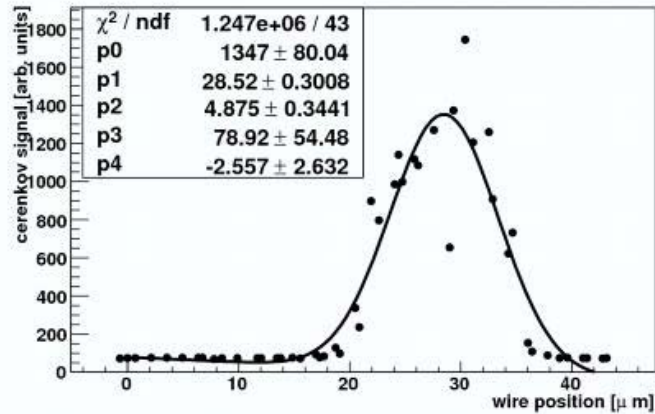

# System improvements

- Added Lead glass calorimeter detector
  - Calibrated with cosmic muons
  - Compare with Aerogel Cerenkov detector
- Integrated DAQ
  - Camac ADCs/TD/TDC
  - Laser power meter
  - ATF-EXT stripline BPMs
  - Wire scanner (stage)
  - Labview control of optics (mirrors)
  - RF phase timing control

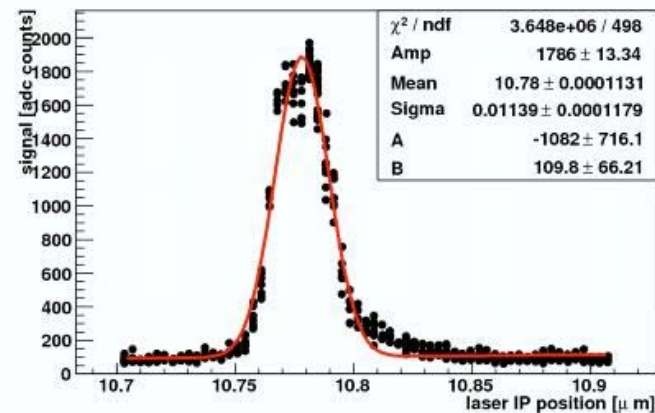

Stewart Boogert

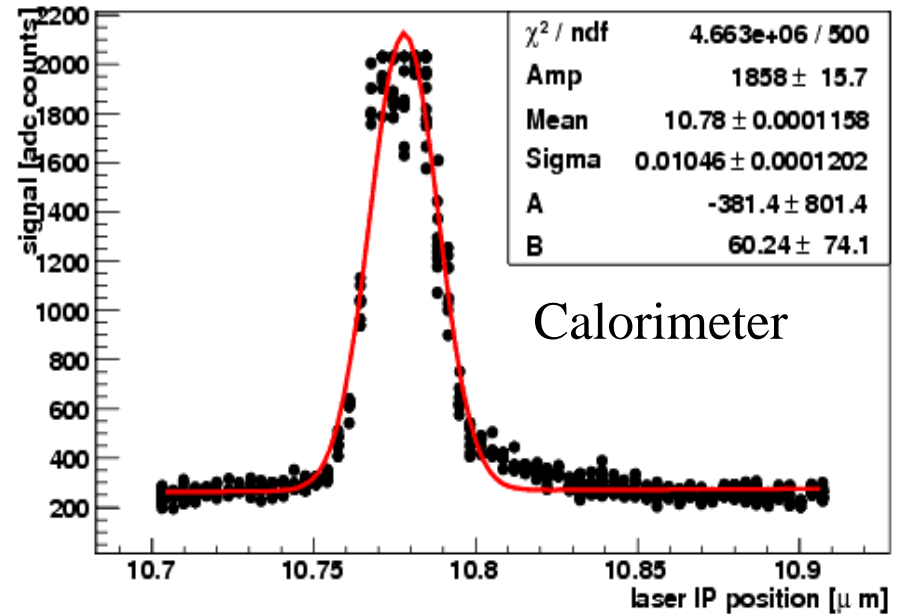

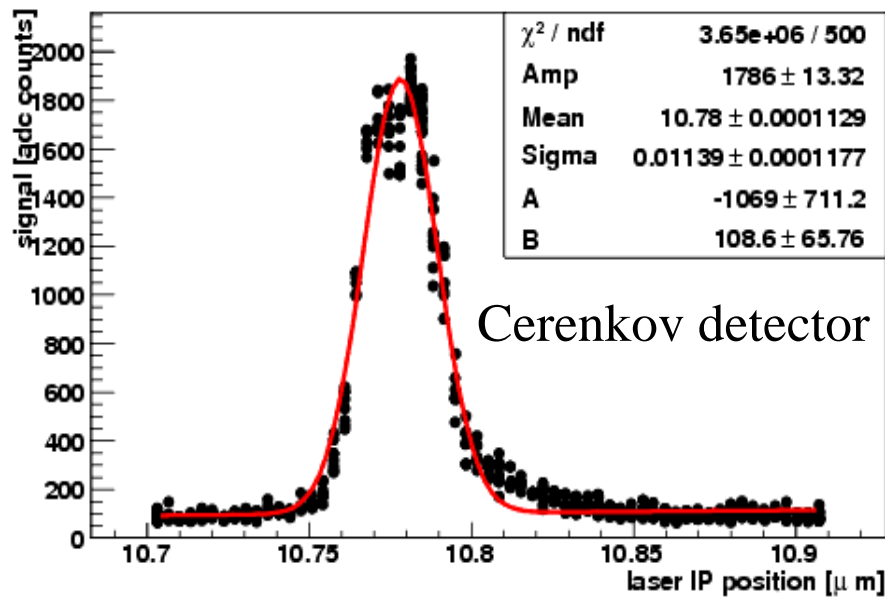

# Results (>Nov 2006)

- Wire scanner measurements to confirm optics
  - Electron beam size  $\sim 4\mu\text{m}$
- Laser scans
  - Laser-electron beam quadrature size  $\sim 11.4\mu\text{m}$

# Photon detector comparison

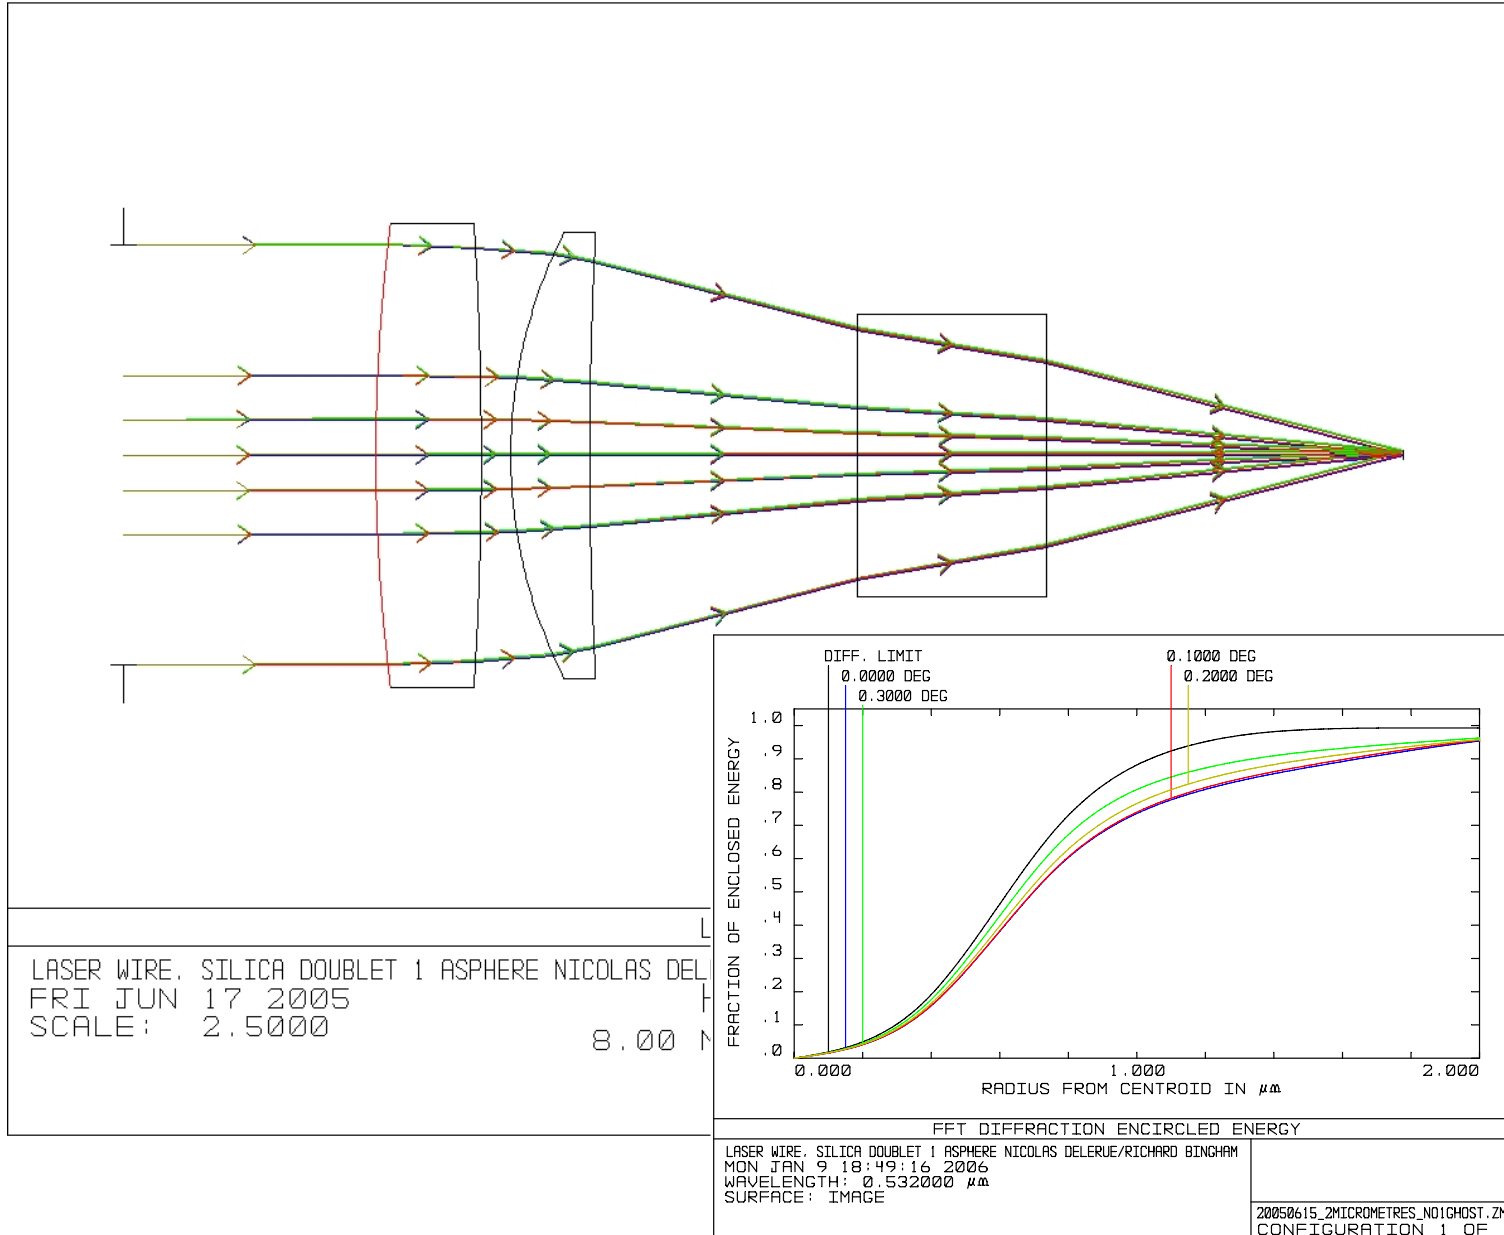

LW Scans 13<sup>th</sup> December 2006

# f/2 lens design @ 532nm

A low f# lens is needed to reach um-scale resolution.

- Focal length: 56mm
- One aspheric element, one flat
- Back focal length: 24mm
- Aperture f/2
- All elements in fused silica
- No primary ghosts, one secondary ghost
- Expected spot radius ~2 micrometres

# Lens profiling

- A precise measurement of the characteristic of the lens as produced is necessary.
- A commercial lens with known properties has been used as benchmark of the test setup.
- Profile measurements with a knife-edge scanner confirm the expected performances.

# Laser development

- Need a high power high repetition rate laser
- Mode quality is very important to achieve good resolution
- => Fibre laser technology with chirped pulse amplification (CPA) best suited for our needs.
- Currently discussing possible systems with several companies

# Outlook

- Two laser-wire prototypes are now operational for ILC related R&D
- 2D scans will soon be attempted with the PETRA system
- Strong focusing lens ( $f/2$ ) performances are being measured
- ATF LW mechanical hardware is being upgraded for the installation of the strong focusing lens
- Laser technology & design have been chosen
