

# Scalar Tops from Morioka'95 to DESY'07

André Sopczak (Lancaster University)

Alex Finch (Lancaster University)

Ayres Freitas (Zürich University)

Caroline Milstène (Fermilab)

Hanna Nowak (DESY)

Michael Schmitt (Northwestern University)

## Outline

- Introduction: developments since Morioka'95
- Importance of polarization
- Vertex detector c-tagging
- Methods of scalar top mass determinations
- Small stop-neutralino mass differences
- Dark matter interpretations
- Precision mass determination near threshold
- Conclusions

# Introduction

- Morioka'95: “Supersymmetric Top **Discovery Potential** at a 500 GeV LC”, AS, Bartl, Eberl, Kraml, Majerotto, Porod(LEP-type detector).
- LCWS Munich'06: “Scalar Quark Mass and Mixing Angle Determination – **an argument for beam polarization**”, AS, Bartl, Eberl, Kraml, Majerotto, Porod.
- “Production and Decay of Stops and Bottoms, and **Determination of SUSY Parameters**”, Bartl, Eberl, Grjdosik, Kraml, Majerotto, Porod, AS, DESY 97-123E.
- “**Search of Stops, Bottom,  $\tau$ -Sneutrino, and Stau at an  $e^+e^-$  Linear Collider with 0.5 to 2 TeV**”, Z. Phys, C76 (1997) 549.
- LCWS Oxford'99: “Scalar Quark Study in the **Neutralino Channel**”, AS.
- LCWS Obernai'99: “Scalar Quark Study in the **Chargino Channel**”, AS.

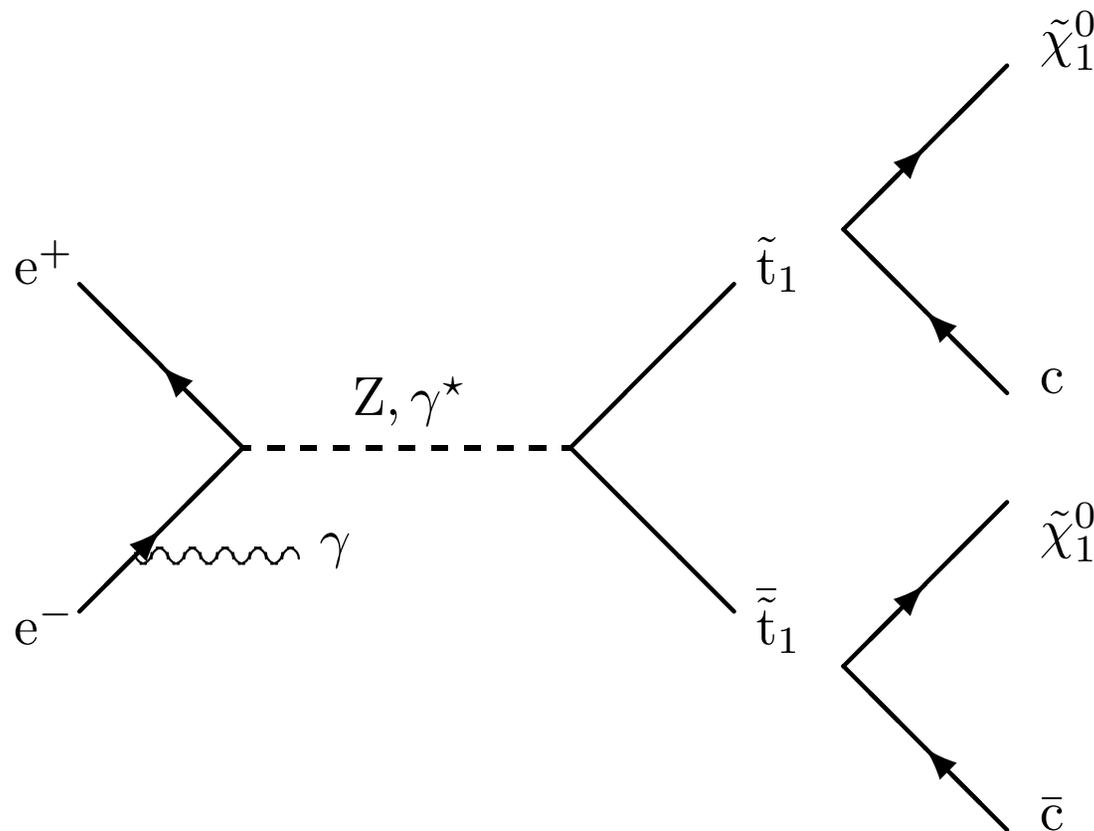

# Iterative Discriminant Analyses

- LCWS Sitges'99: “Study of Scalar Top Quarks”,
  - a) *Iterative Discriminant Analysis (IDA)*,
  - b) *Simulation Grand Vitesse (SGV)*, detailed LC det. description, Berggren, Keranen, Nowak, AS, EPJDirect C7 (2000) 1.
- LCWS Chicago'00, Scalar Top in the *Neutralino and Chargino Channel*, Nowak, AS.
- LCWS Snowmass'01, Scalar Top *benchmark point SPS-5*, AS.
- LCWS Jeju'02, “Precision measurements” *SIMDET with LCFI vertex detector c-tagging*, AS, Finch, Nowak.
- LCWS Amsterdam'03, “*A new Scalar Top Analysis*”, AS, Finch, Nowak, hep-ph/0309235 (Kalinowski et al).
- LCWS Paris'04, “*LCFI CCD Vertex Detector Charm-Tagging*” and “*Four Mass Determination Methods*”, AS, Finch, Nowak.

# Dark Matter, Mass Precision

- LCWS Stanford'05 “**Analysis of Stops with Small Stop-Neutralino Mass Difference**”, Milsténe, Carena, Finch, Freitas, Nowak, AS
- Snowmass'05: Scalar top studies as a **benchmark for vertex detector c-quark tagging**, Milsténe, AS, 2005-alcpg1431.
- Bangalore'06, “**Small Visible Energy Scalar Top Iterative Discriminant Analysis**” ( **$\sqrt{s} = 260$  GeV scenario**), AS, Finch, Freitas, Milsténe, Schmitt
- SUSY'06, “**Small Visible Energy Scalar Top Iterative Discriminant Analysis**” ( **$\sqrt{s} = 500$  GeV scenario**). AS, Finch, Freitas, Milsténe, Schmitt.
- **LCWS DESY'07, “Precision Measurements of the Stop Mass”**, Milsténe, Freitas, Schmitt, AS. **Threshold, fragmentation effects, retuning of IDA, reduction of systematic uncertainties by  $\sqrt{s} = 260$  and 500 GeV analyses.**

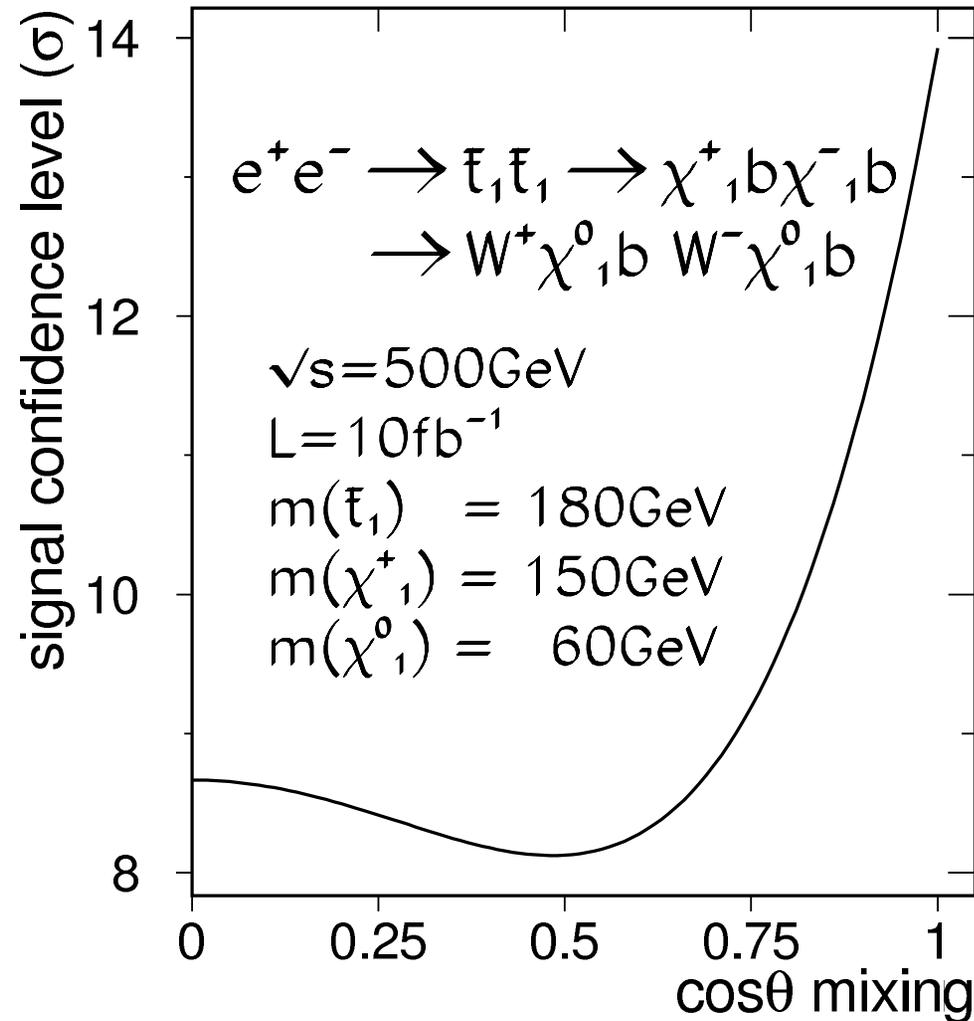

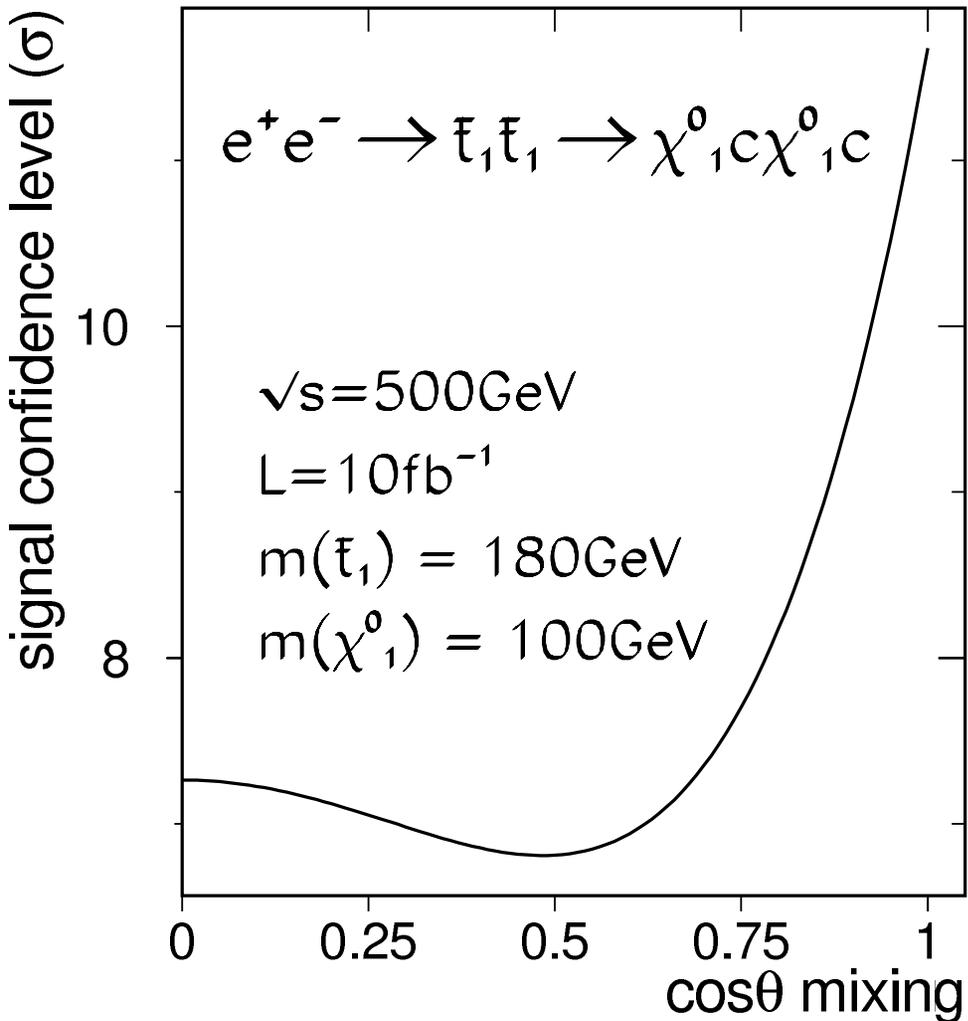

# c-Quark Tagging: a Benchmark Reaction

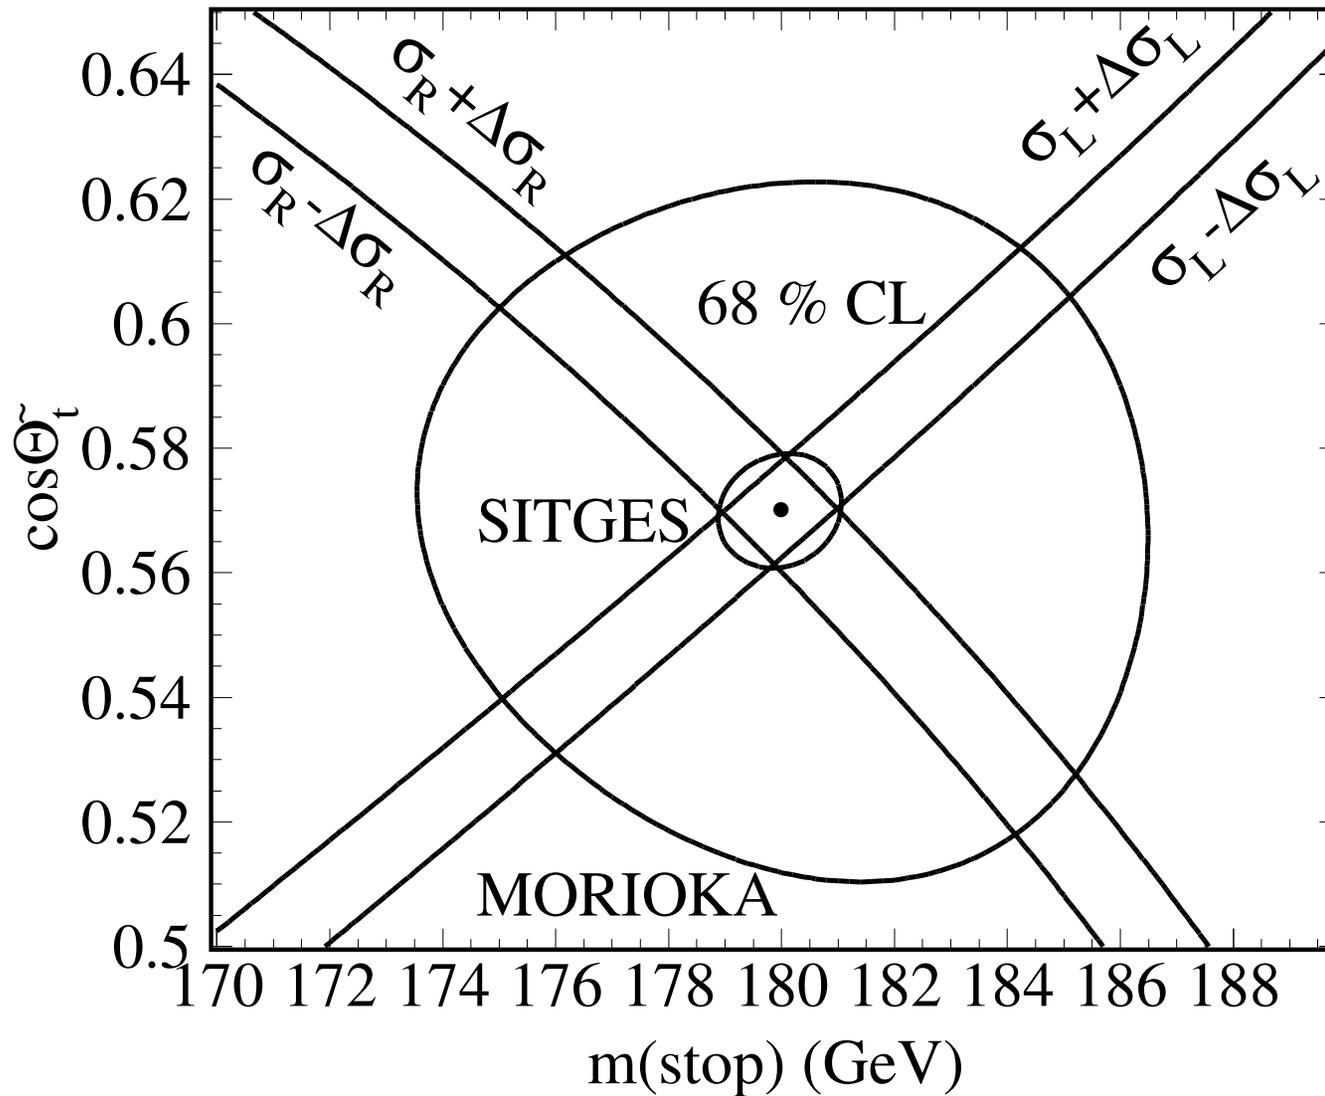

Signal: Two charm jets and missing energy.

Benchmark reaction in the Supersymmetry framework:  $e^+e^- \rightarrow \tilde{t}_1\tilde{t}_1^- \rightarrow c\tilde{\chi}_1^0\bar{c}\tilde{\chi}_1^0$

# Expected LC Significance ( $\sigma = s/\sqrt{b}$ ) Morioka'95

# Development Morioka'95 to Sitges'99

- $L_M = 10 \text{ fb}^{-1}$
- $L_S = 500 \text{ fb}^{-1}$
- Morioka:  
sequential-cut  
based selection
- Sitges: IDA

## Detector Aspects

Major challenge to develop a vertex detector for a future LC.

Key aspects:

- Distance to interaction point of innermost layer is crucial (radiation hardness, beam background).
- Material absorption length (multiple scattering).
- Tagging performance.

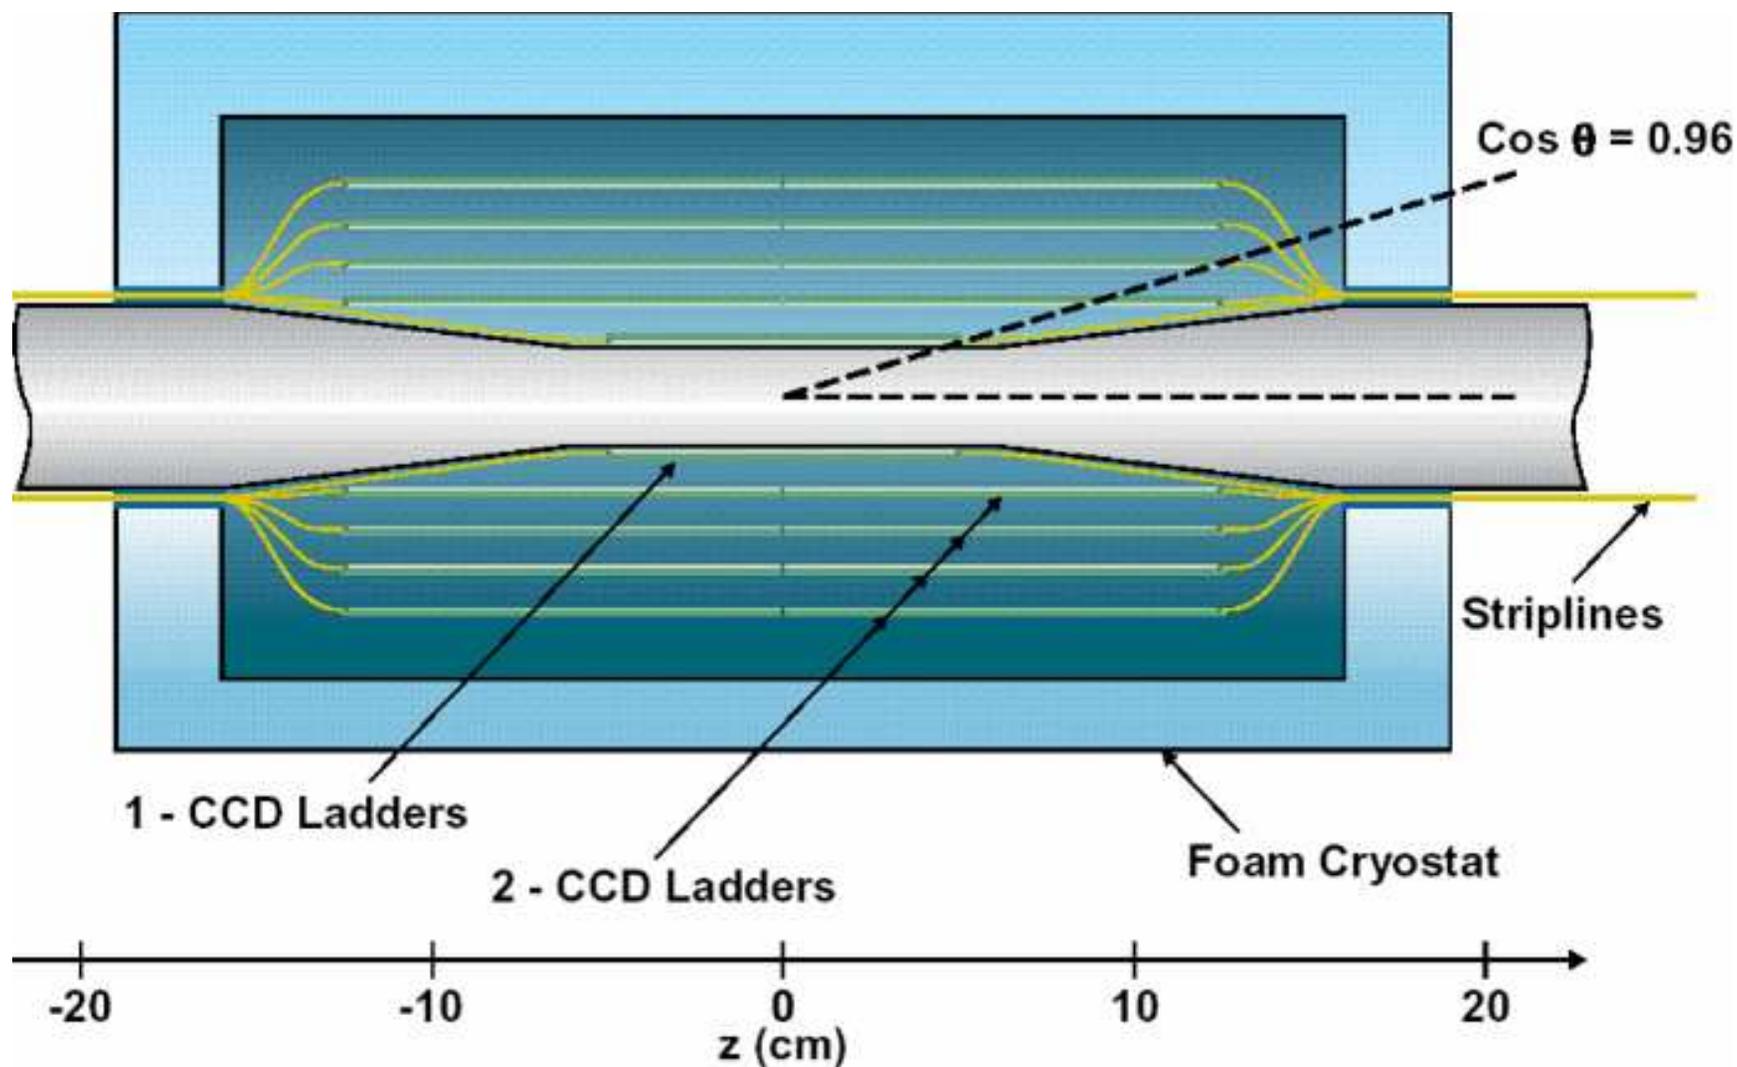

While at previous and current accelerators (e.g. SLC, LEP, Tevatron) b-quark tagging has revolutionized many searches and measurements, c-quark tagging will be very important at a future LC:

Linear Collider Flavour Identification (LCFI) collaboration.

c-quark tagging is a benchmark for vertex detector developments.

New c-tagging Vertex Package just released (Sonja Hillert et al).

LCFI Collaboration: Development of a CCD detector for a future LC.  
This CCD detector is implemented in c-tagging simulations.

5 CCD layers at 15, 26, 37, 48 and 60 mm. Each layer  $< 0.1\% X_0$ .

# Signal and Background Cross Section

Two scenarios:

1. Comparison previous SGV study:  $m_{\tilde{t}_1} = 180$  GeV,  $m_{\tilde{\chi}_1^0} = 100$  GeV
2. **SPS-5** SUSY parameters:  $m_{\tilde{t}_1} = 220.7$  GeV,  $m_{\tilde{\chi}_1^0} = 120$  GeV

Decays mode (kinematics)  $\tilde{t}_1 \rightarrow \tilde{\chi}_1^0 c$ .

Signal and background cross section (pb):

$\tilde{t}_1 \tilde{t}_1^- (180/220.7)$	$W e \nu$	WW	q $\bar{q}$	t $\bar{t}$	ZZ	eeZ
CALVIN32	GRACE	WOPPER	HERWIG	HERWIG	COMPHEP	PYTHIA
0.0532/0.0164	5.59	7.86	12.1	0.574	0.864	0.6

For this performance study: no beam polarization.

However, beam polarization is very important for mass and mixing angle determination.

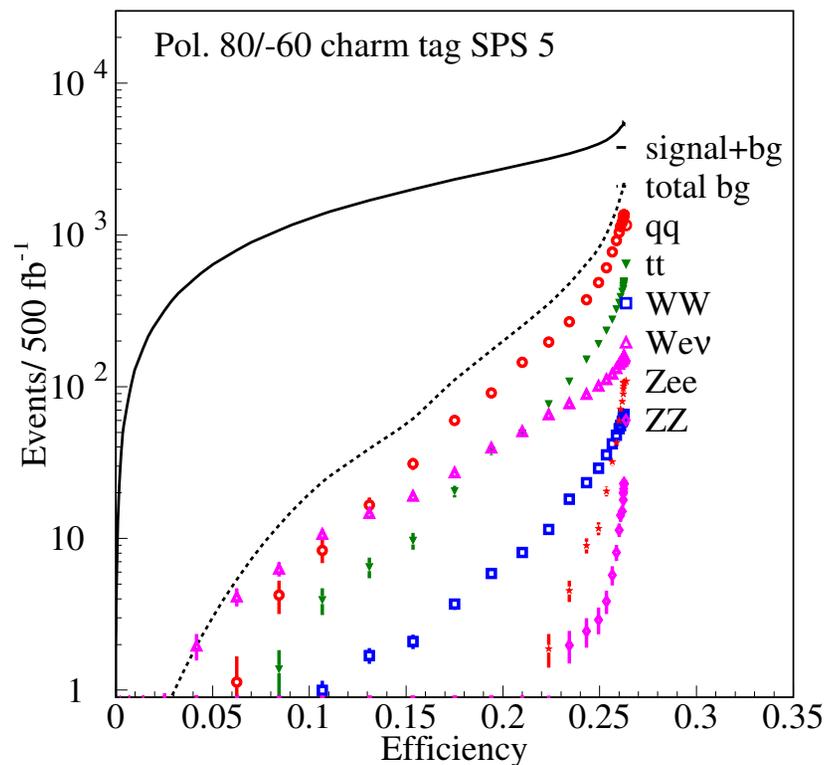

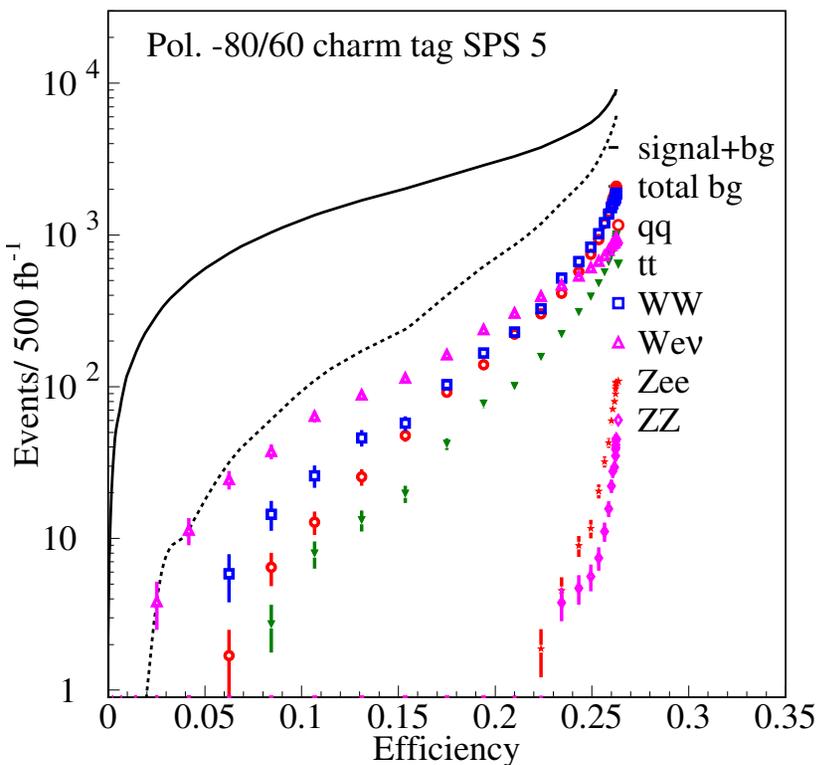

## Typical Analysis Strategy

- Signal and Background generated for  $500 \text{ fb}^{-1}$  and  $\sqrt{s} = 500 \text{ GeV}$
- Detector Simulation: SIMDET 4.03 (J. Schreiber et al.)
- b/c tagging algorithm (T. Kuhl et al.)
- Iterative Discriminant Analysis (IDA) for selection optimization
- Different Vertex Detector configurations

## Four Different Methods of Mass Determination

- Two 'IDA' based selection -  
Optimum Signal/Background ratio:
  - Cross section with different **polarizations**
  - **Threshold** dependence of cross section
- Two cut based selection -  
Minimum distortion of final state observables
  - **Endpoint** of jet energy spectrum
  - **Minimum Mass** of jets (J. Feng)

# Selection Efficiency for Different Beam Polarizations

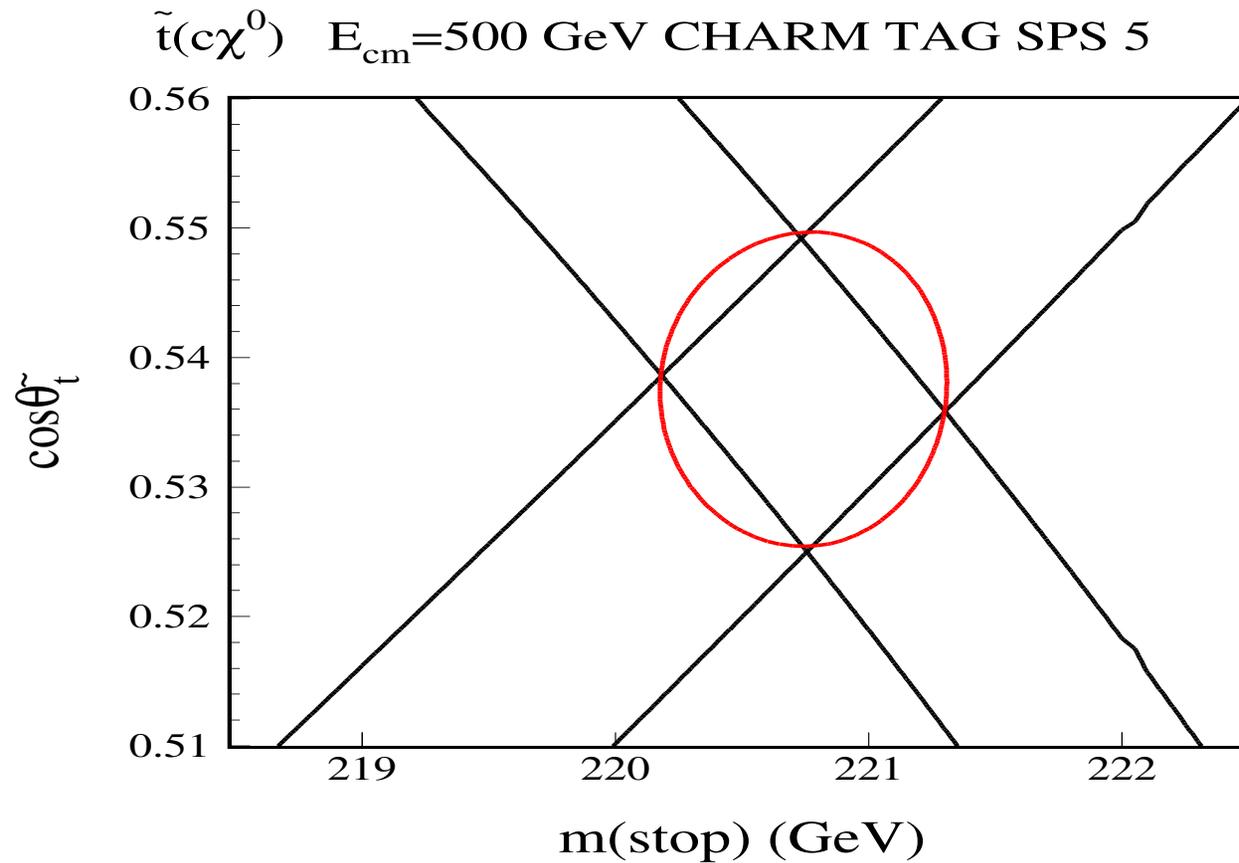

At 12%  
Efficiency { Signal: 1350  
Background: 145

1500  
32

# Results from Polarization Method

Dependence of cross section on scalar top mass and mixing angle:

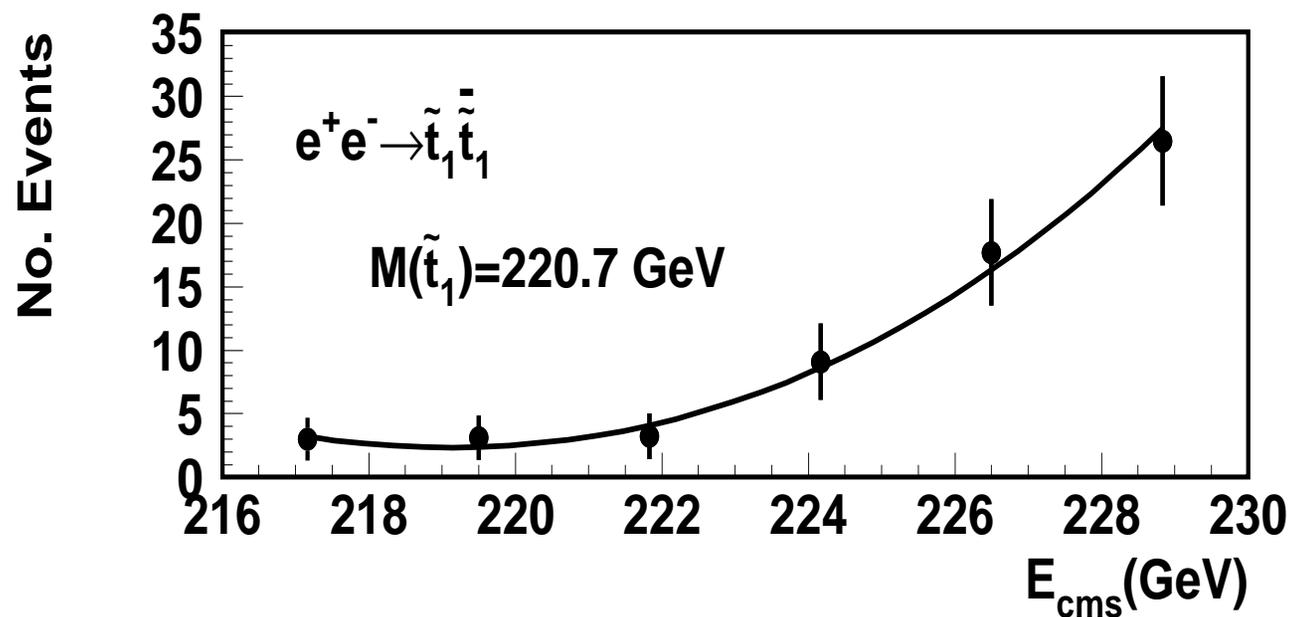

$500 \text{ fb}^{-1}$  for each polarization:  $\Delta m_{\tilde{t}_1} = \pm 0.57 \text{ GeV}$        $\Delta \cos\theta_{\tilde{t}} = \pm 0.012$

## Threshold Scan Method

Use 'right-handed polarization' to reduce backgrounds

Measure cross section close to threshold

6 points with  $50 \text{ fb}^{-1}$  per point.

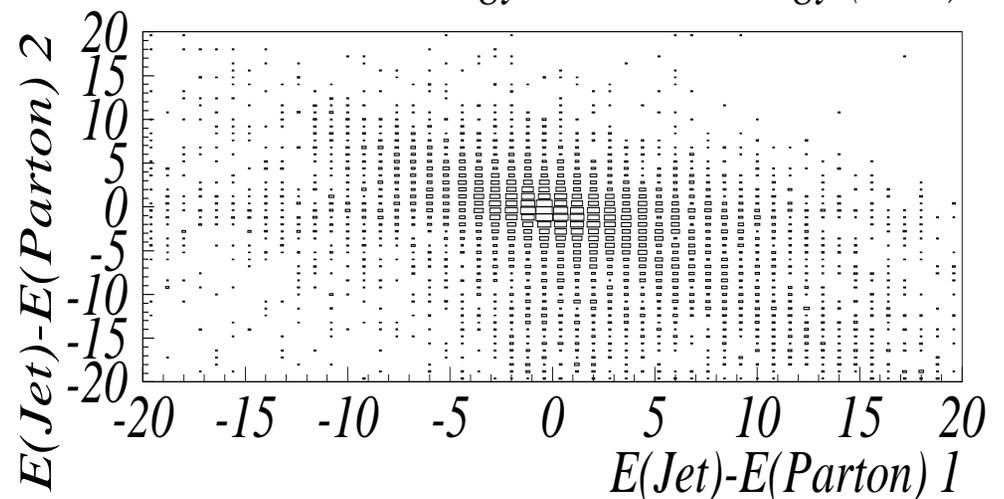

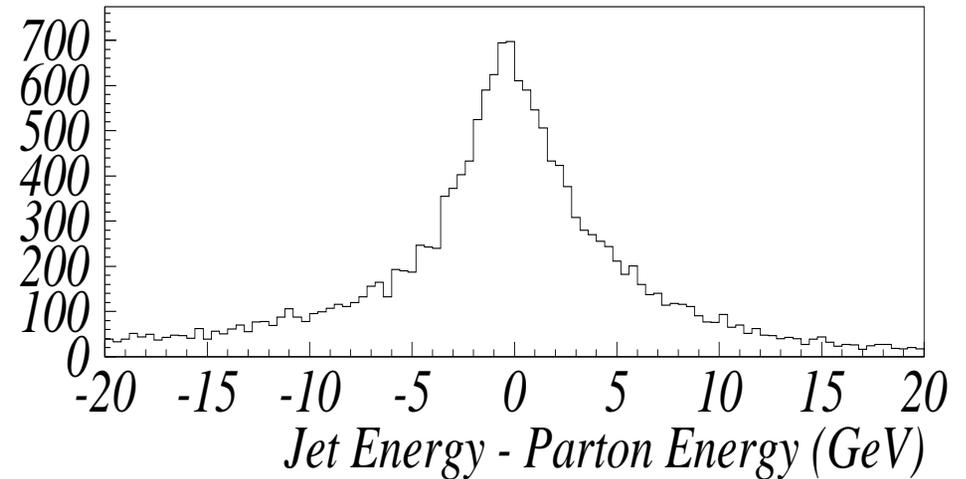

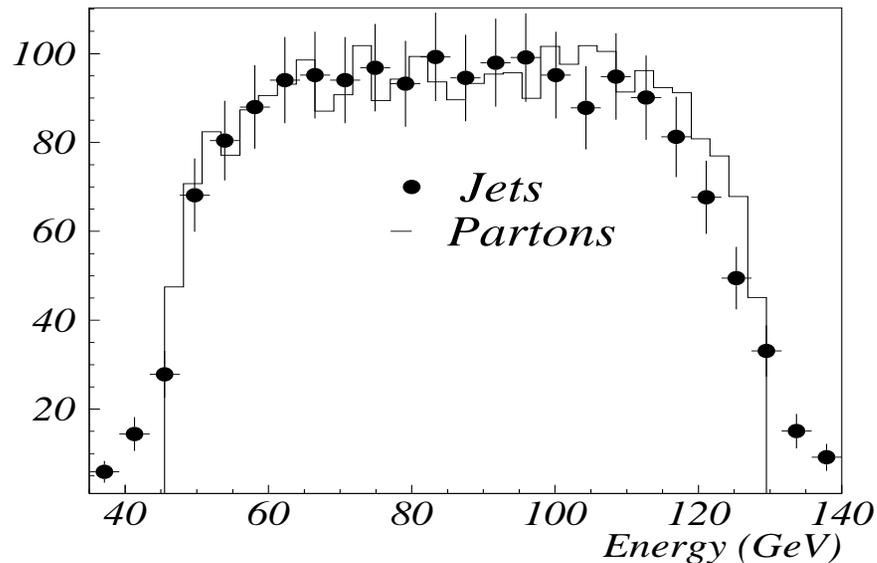

Mass from fit to shape:  $220.9 \pm 1.2 \text{ GeV}$

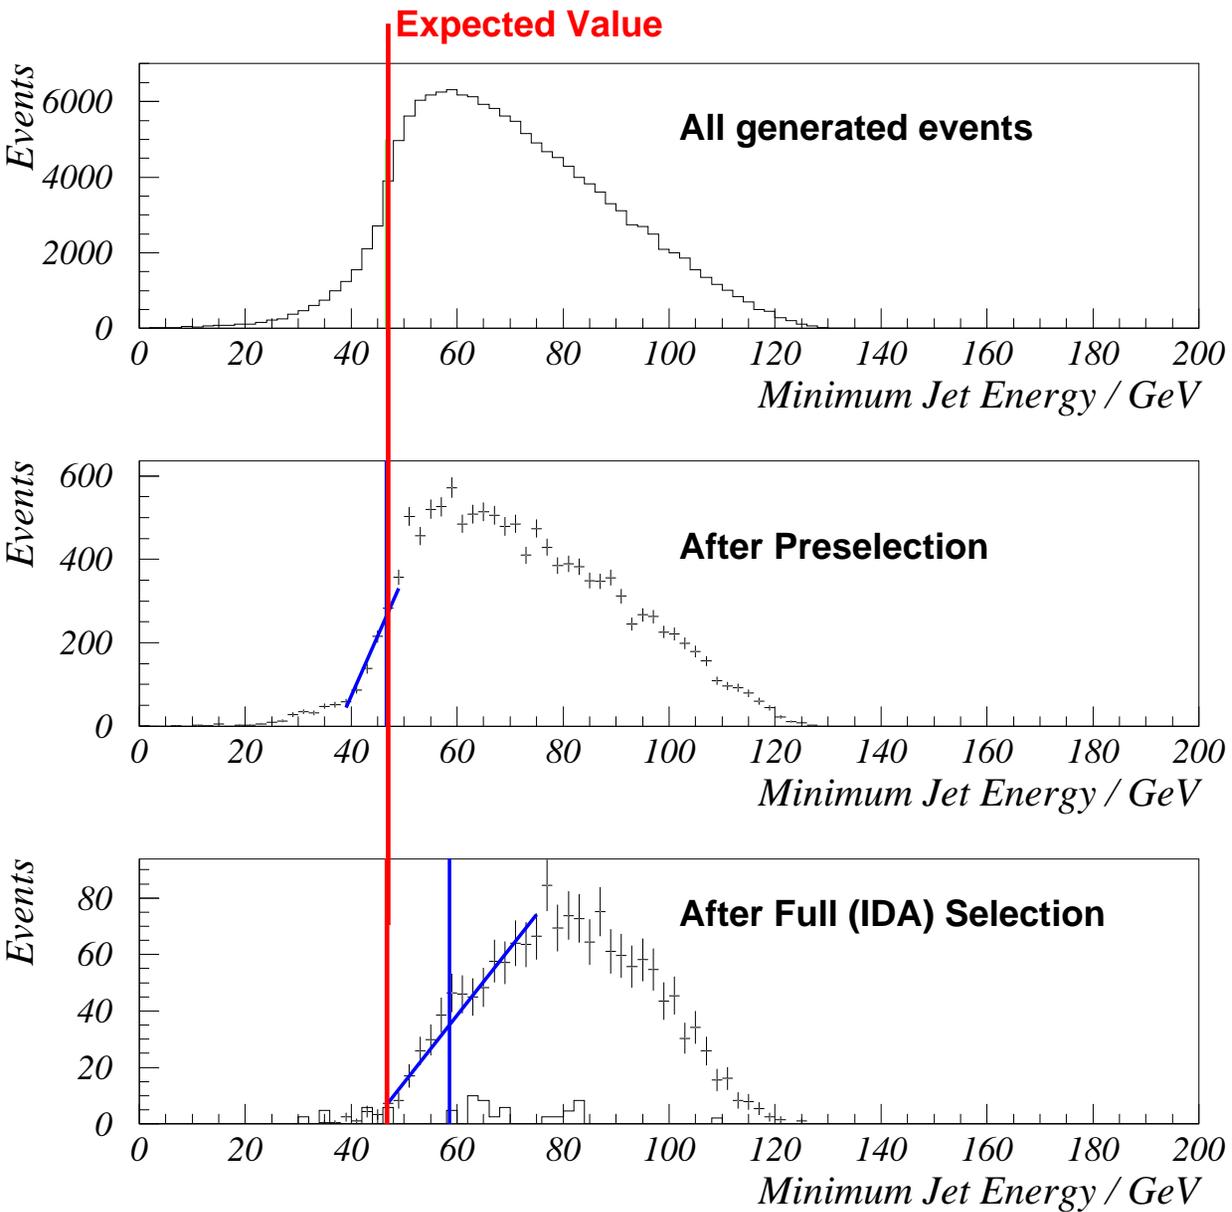

# Direct Measurements from Jet Energies

'End Point Method' and 'Minimum Mass Method'

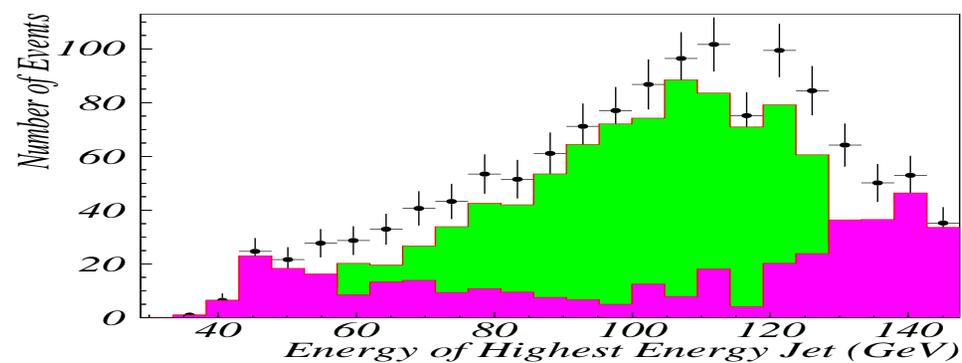

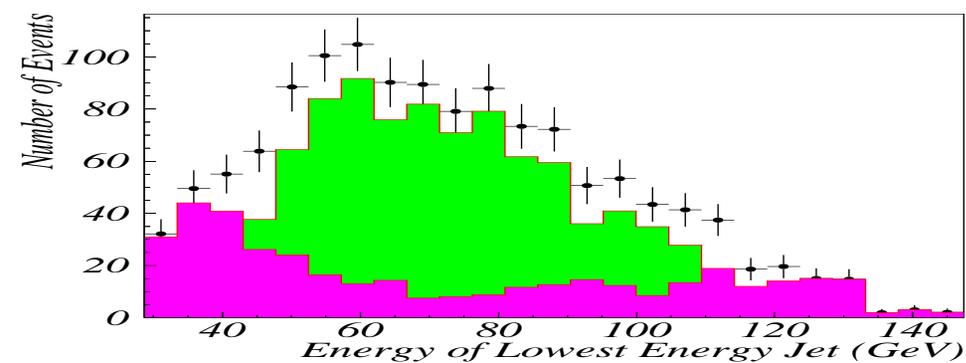

Require quark energies, but one measures jets.

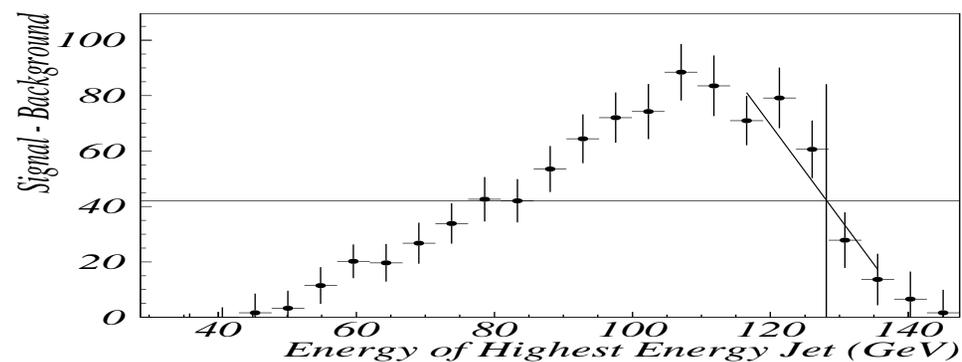

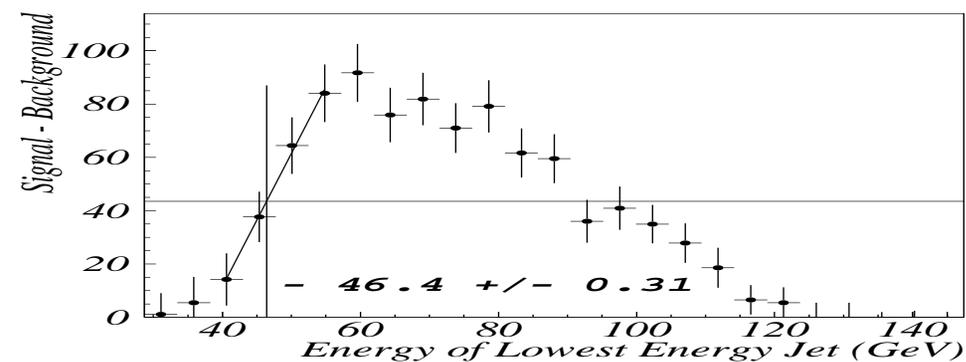

# Effect of IDA Selection on Min. Jet Energy

# Jet Energy using Selection Cuts at SPS5

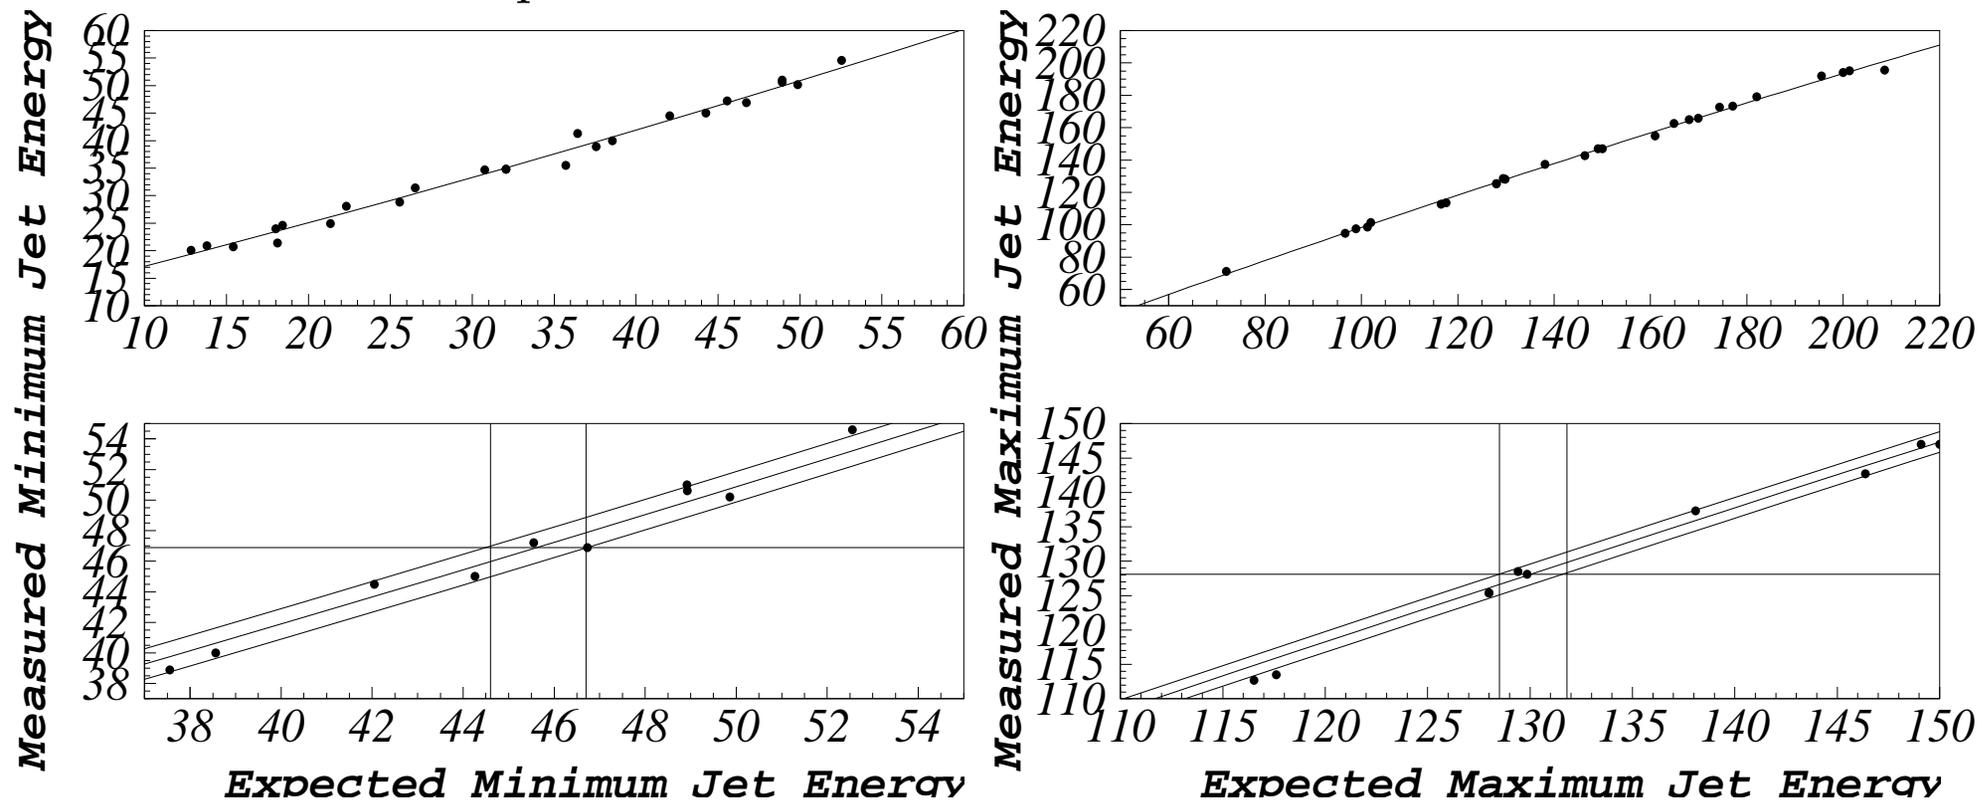

Subtract Background. Straight line fit to decreasing and increasing slopes.

Measure Endpoints at Half Height Position (statistical uncertainty is small).

# Jet Energy using Selection Cuts at SPS5

Generate several samples to obtain 'calibration curves'

$$\text{Minimum Jet Endpoint} = 45.7 \pm 1.0 \text{ GeV}$$

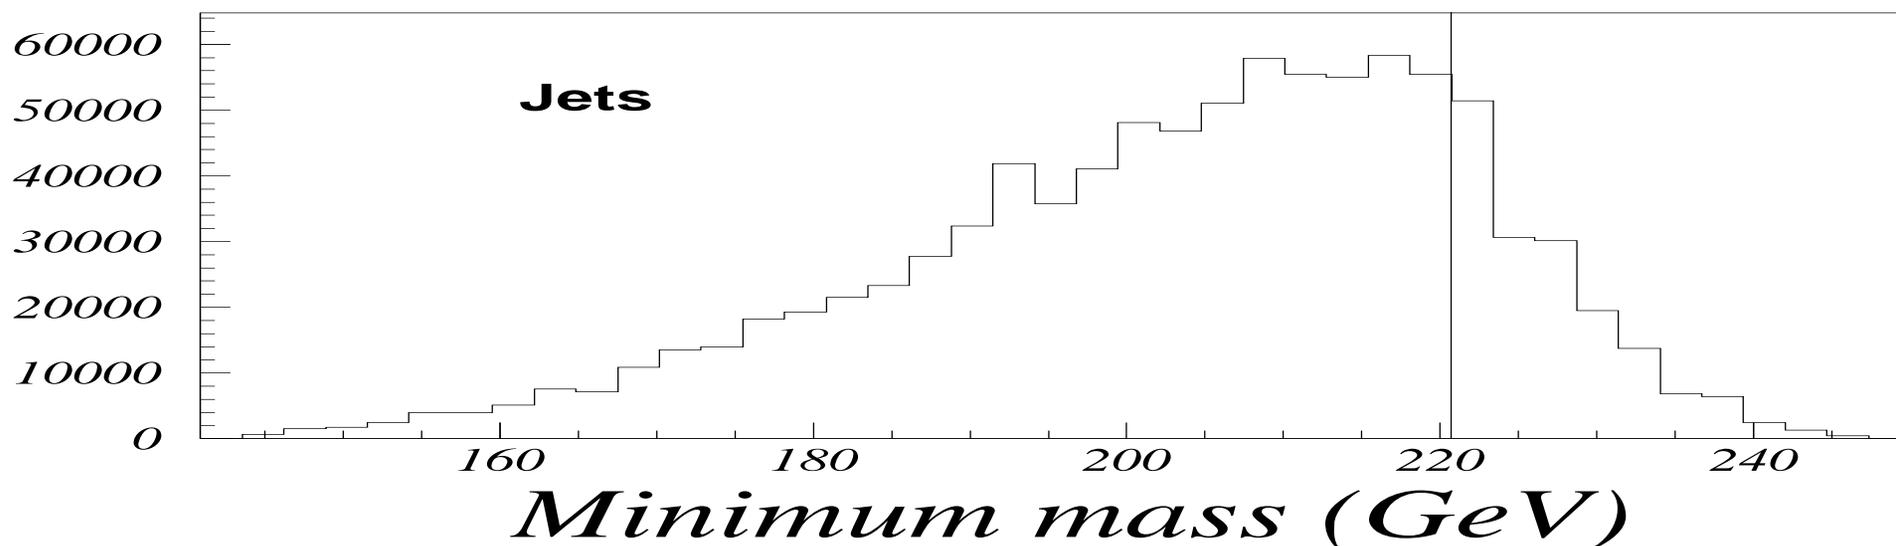

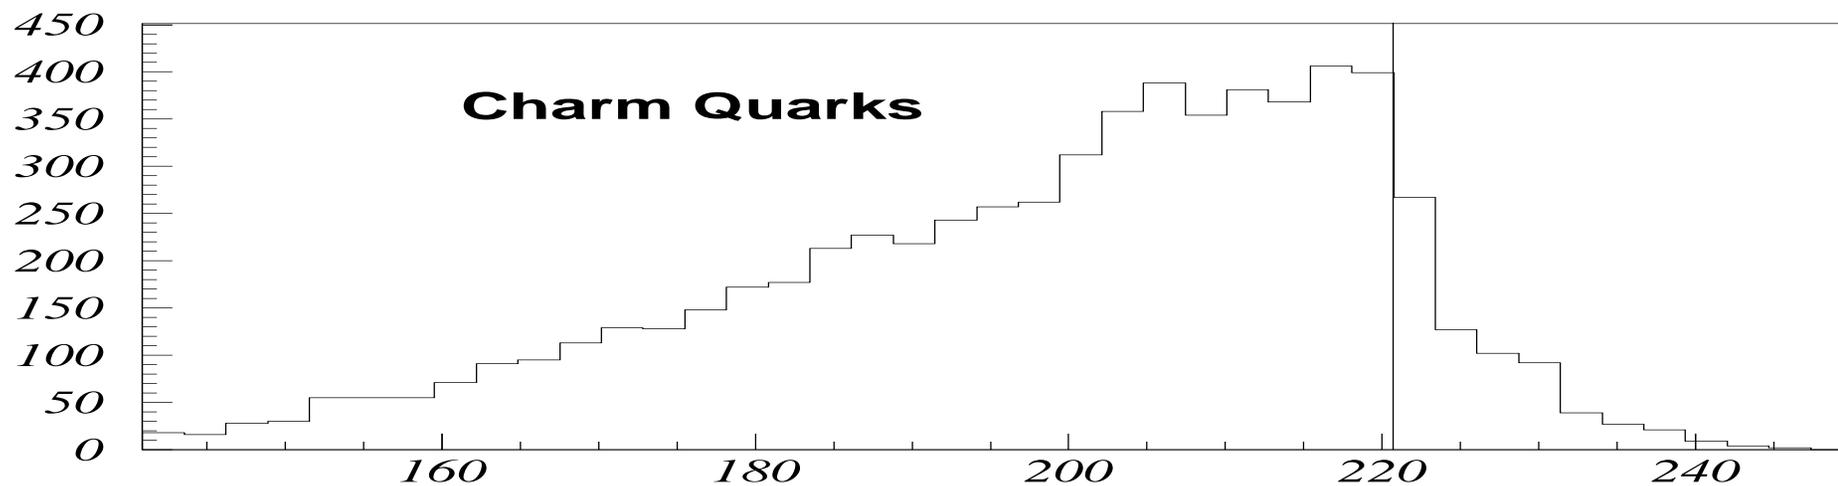

$$\text{Maximum Jet Endpoint} = 130.2 \pm 1.5 \text{ GeV}$$

$$m_{\tilde{t}_1} = 219.3 \pm 1.7 \text{ GeV}$$

$$m_{\tilde{\chi}_1^0} = 119.4 \pm 1.6 \text{ GeV}$$

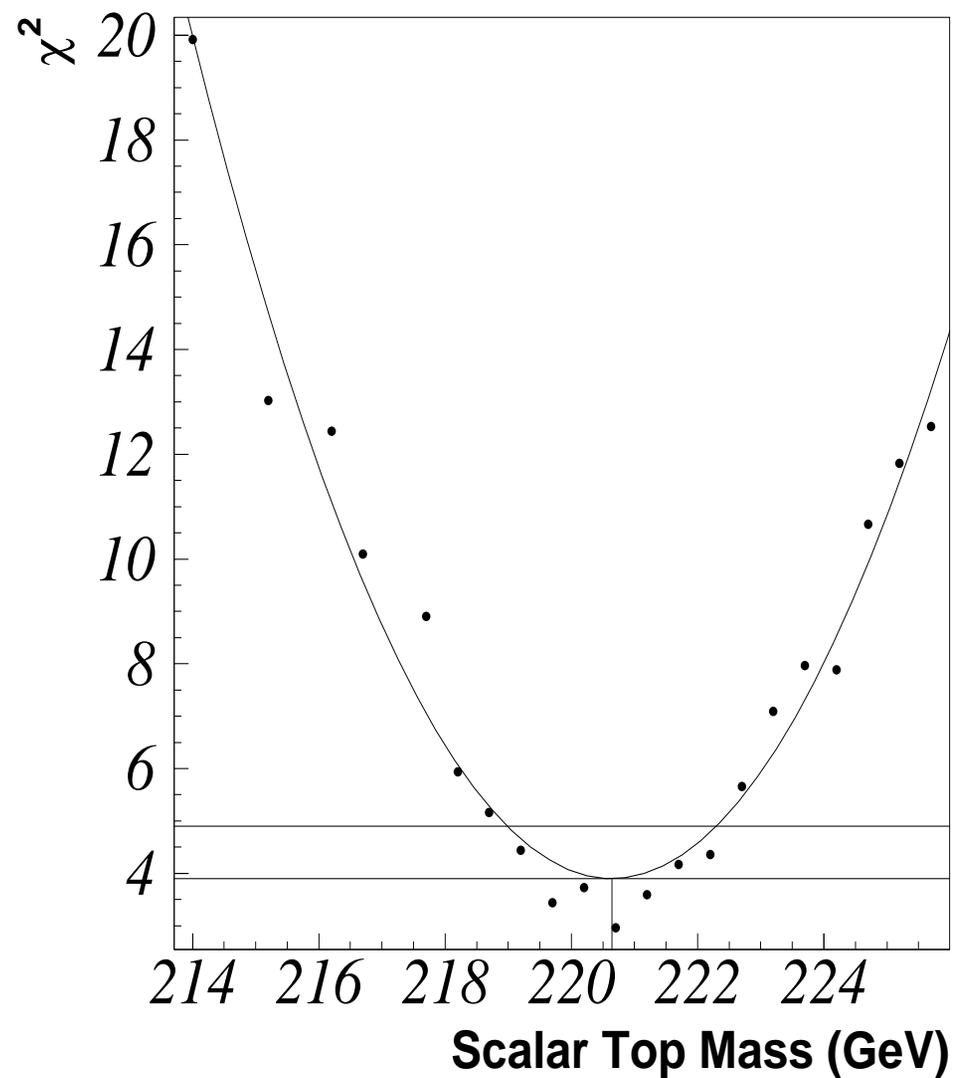

# Minimum Mass Method

If  $m_{\tilde{\chi}_1^0}$  is known: calculate minimum allowed mass of the two jets; it peaks at  $m_{\tilde{t}_1}$ .

## Fit to Find Error on Mass

- Monte Carlo samples - varying  $m_{\tilde{t}_1}$
- Fit minimum mass distribution.
- Result:  $m_{\tilde{t}_1} = 220.5 \pm 1.5$  GeV

# Summary of Mass Determinations for SPS-5

- IDA selection provides high purity and efficiency.
- Allows  $m_{\tilde{t}_1}$  measurement via:
  1. Combining Different Beam Polarizations
  2. Threshold Scan
- Selection cuts reduce distortions of Jet Energy Spectrum
- Allows  $m_{\tilde{t}_1}$  measurement via:
  1. End Point Method
  2. Minimum Mass Method

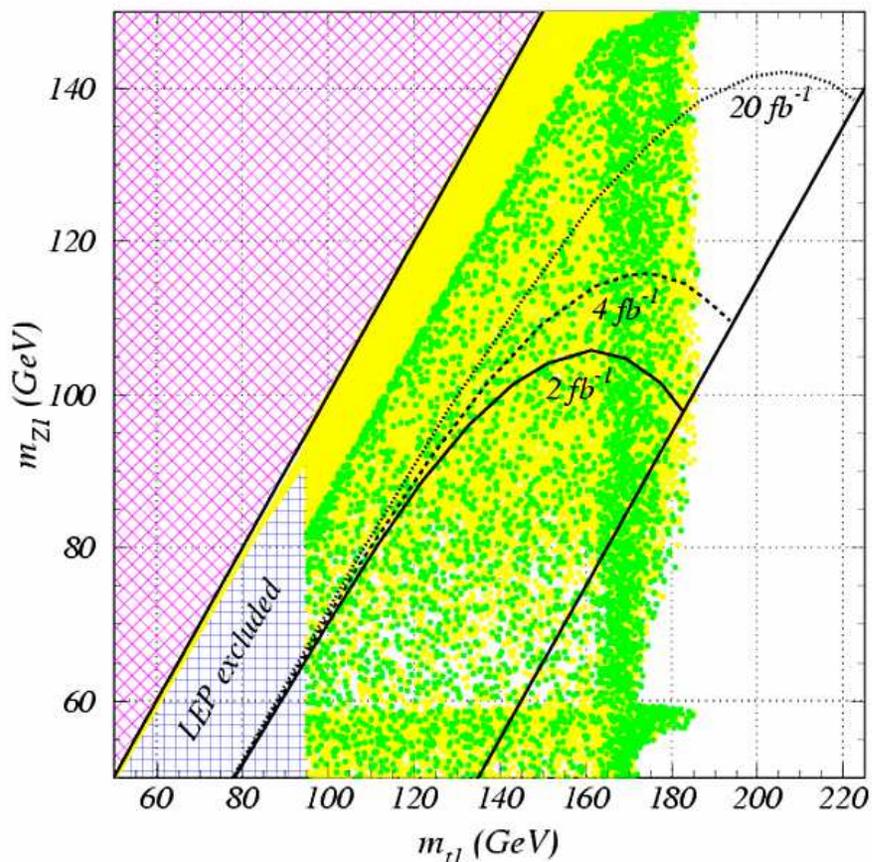

Method	$\Delta_m$ (GeV)	luminosity	comment
Polarization	0.57	$2 \times 500 \text{ fb}^{-1}$	no theory errors included
Threshold Scan	1.2	$300 \text{ fb}^{-1}$	right hand polarization
End Point	1.7	$500 \text{ fb}^{-1}$	
Minimum Mass	1.5	$500 \text{ fb}^{-1}$	assumes $m_{\tilde{\chi}_1^0}$ known

# Small Stop-Neutralino Mass Difference Studies

## Motivations:

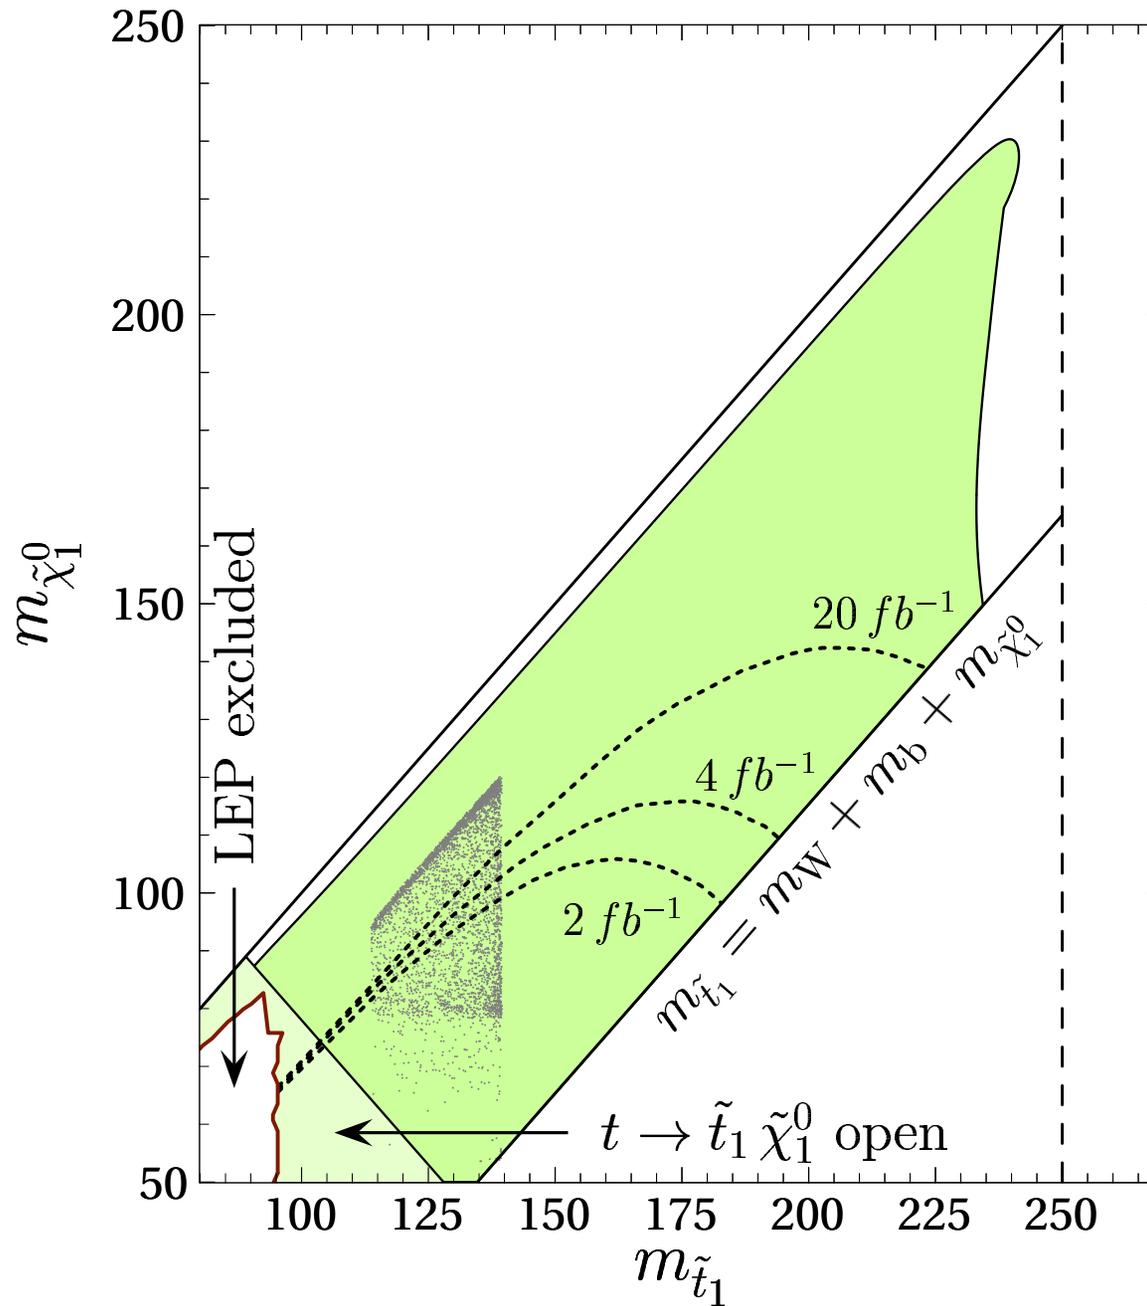

- Baryogenesis (Carena, Quirós, Wagner '96):  $m_{\tilde{t}_1} < m_t$
- Dark Matter (Carena, Balázs, Wagner '04):  $\tilde{\chi}_1^0$  is Cold Dark Matter (CDM) candidate. Correct CDM rate for small  $\tilde{t}_1 - \tilde{\chi}_1^0$  mass difference (co-annihilation).
- Small and large visible energy: radius of innermost Vertex Detector layer most important. physics/0609017 (Milsténe, AS).

MSSM

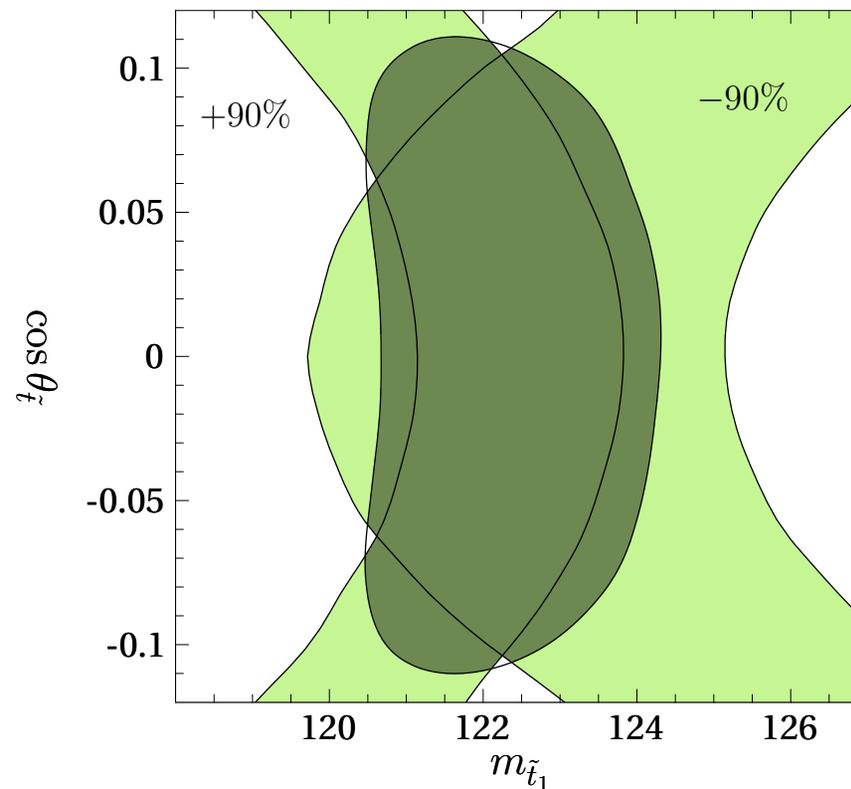

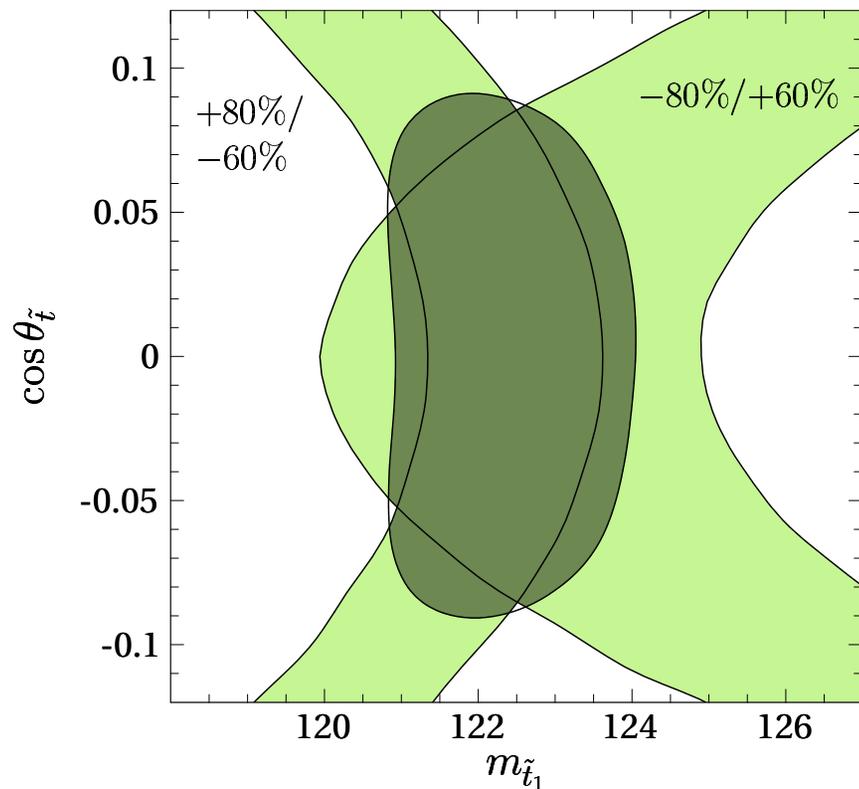

- Green: Relic density consistent with WMAP
- Co-annihilation for small  $\Delta m = m_{\text{stop}} - m_{\text{neutralino}_1}$
- Difficult for searches at the Tevatron and LHC

# Discovery Reach

# Determination of Stop Mass and Mixing Angle

$e^-$  and  $e^+$  polarization:  $\Delta m_{\text{stop}} = 1.0 \text{ GeV}$ ,  $\|\cos \theta\| < 0.074$ .

$e^-$  polarization only:  $\Delta m_{\text{stop}} = 1.25 \text{ GeV}$ ,  $\|\cos \theta\| < 0.091$ .

# Systematic and Statistical Uncertainties

- $\delta m_{\tilde{\chi}_1^0} = 0.3 \text{ GeV}$  (hep-ph/0608255 Carena, Freitas)
- Polarization:  $\delta P(e^\pm)/P(e^\pm) = 0.5\%$
- Background rate  $\delta B/B = 0.3\%$
- Scalar top hadronization and fragmentation:  $< 1\%$
- c-quark tagging:  $< 0.5\%$
- Detector calibration:  $< 0.5\%$
- Beamstrahlung:  $< 0.02\%$

Sum of systematic uncertainty: 1.3%(l), 1.2% (r) reduces to 0.8%.

Statistical uncertainty: 0.8%.

Typical small  $\Delta m$  (15 GeV) parameter point:

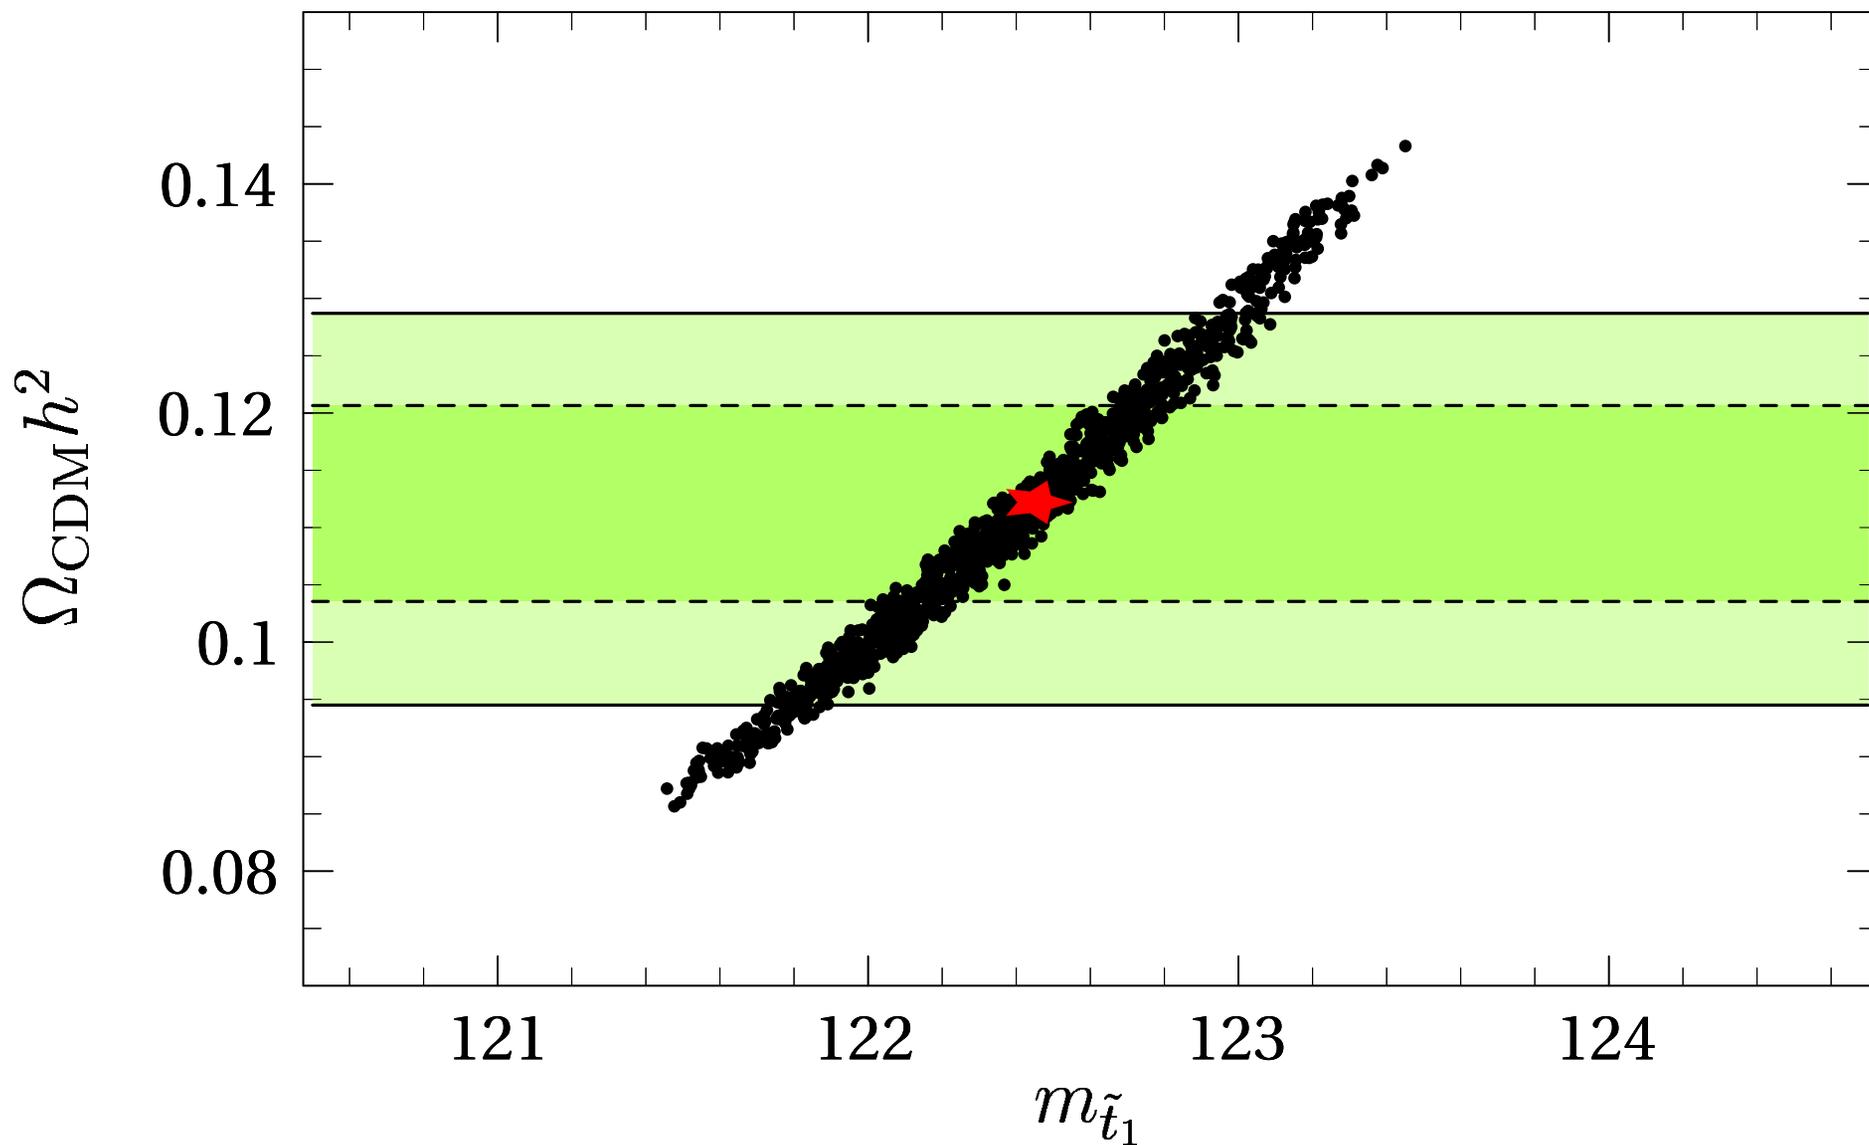

For  $250 \text{ fb}^{-1}$  for each polarization:

$$m_{\tilde{t}_1} = 122.5 \pm 1.0 \text{ GeV} \quad |\cos \theta_{\tilde{t}}| < 0.074$$

# Dark Matter Prediction

Included all parameters and their errors (e.g.  $\tilde{\chi}_1^0/\tilde{\chi}_1^+$  measurements).

Stop mass uncertainty is dominant for CDM co-annihilation precision.

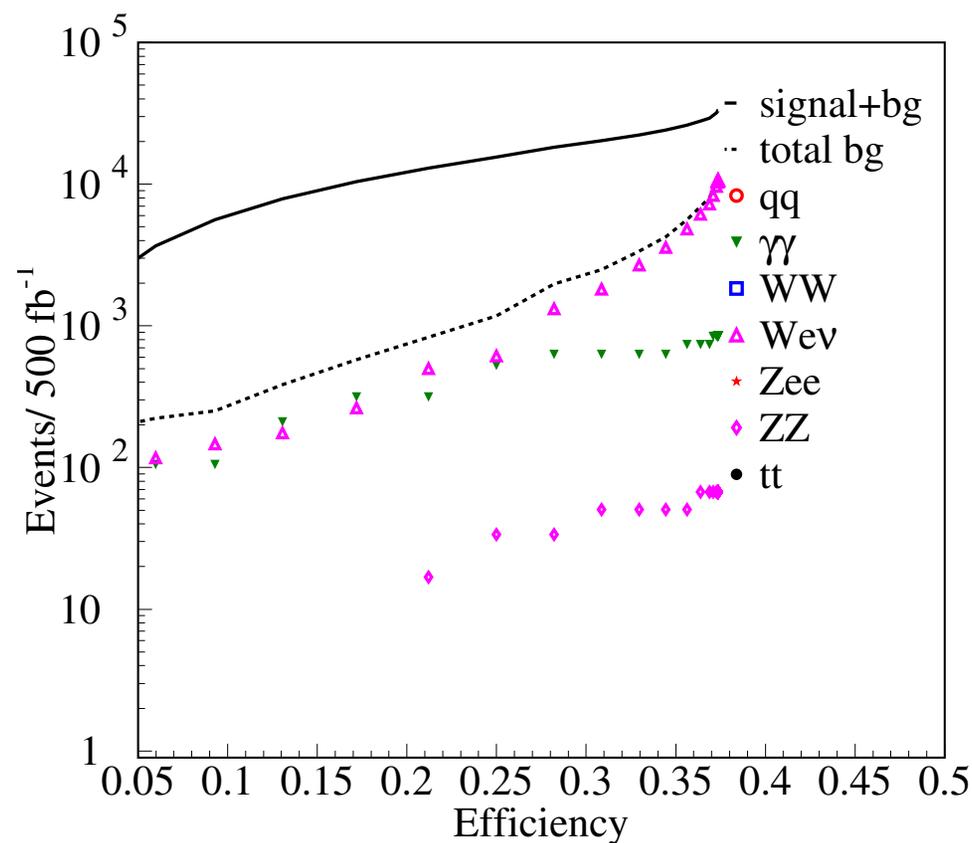

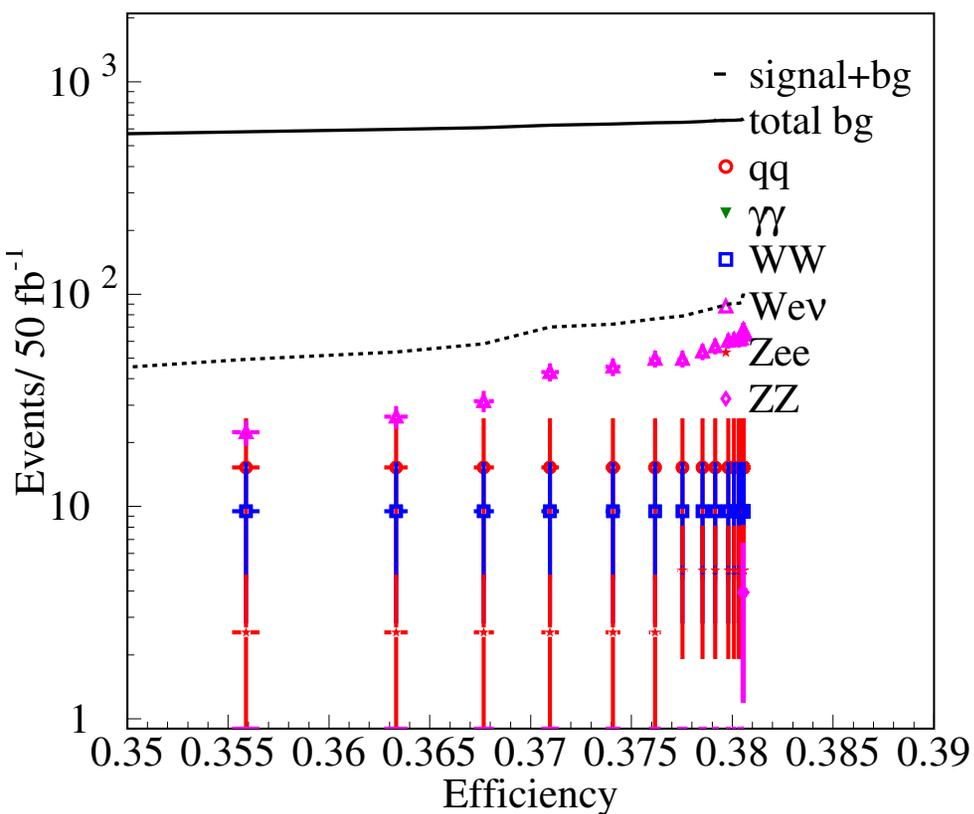

WMAP: 1, 2 $\sigma$  bands. LC: precision.

# Precision Mass Determination → C. Milstène SUSY session

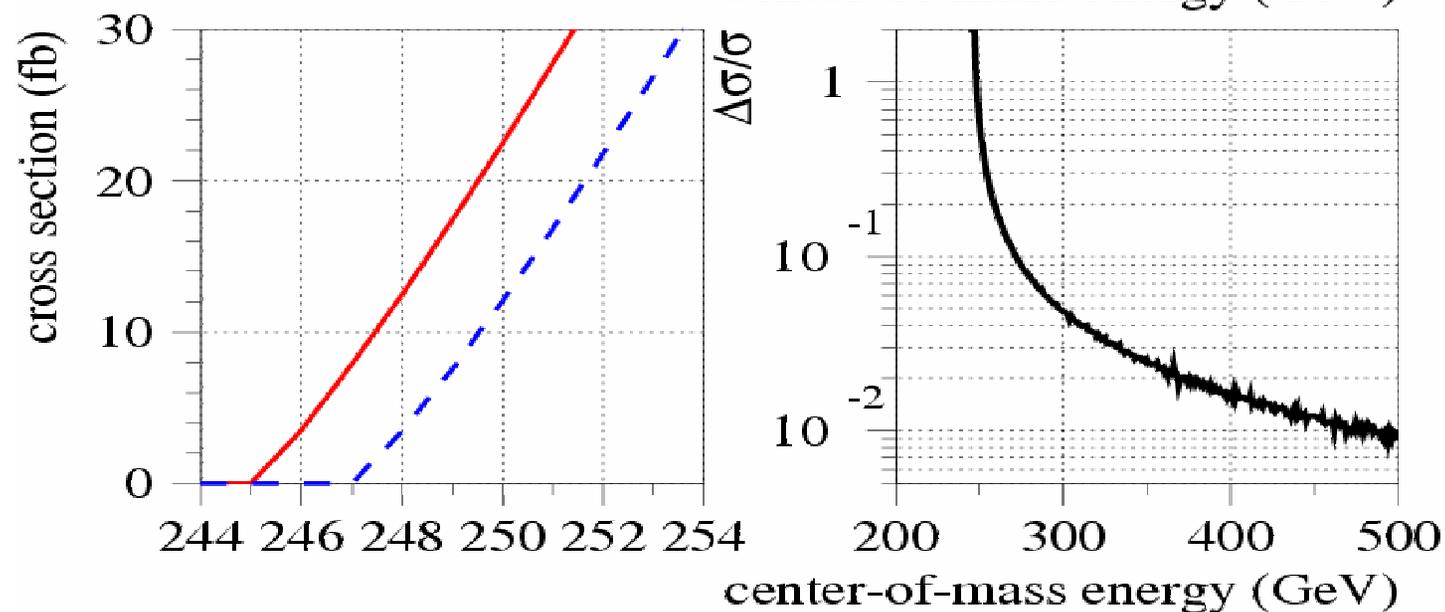

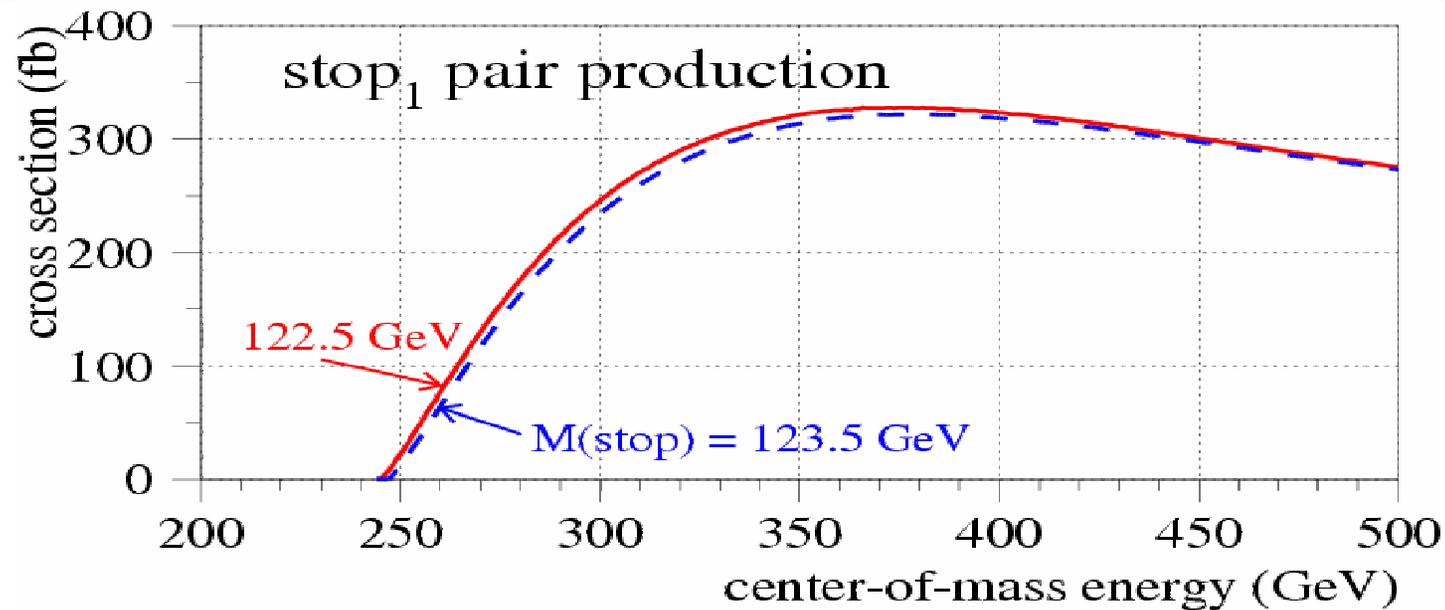

Method: measure cross section at two  $\sqrt{s}$ , one of them near threshold to reduce systematic uncertainties. Stop hadronization effect included in new simulation.

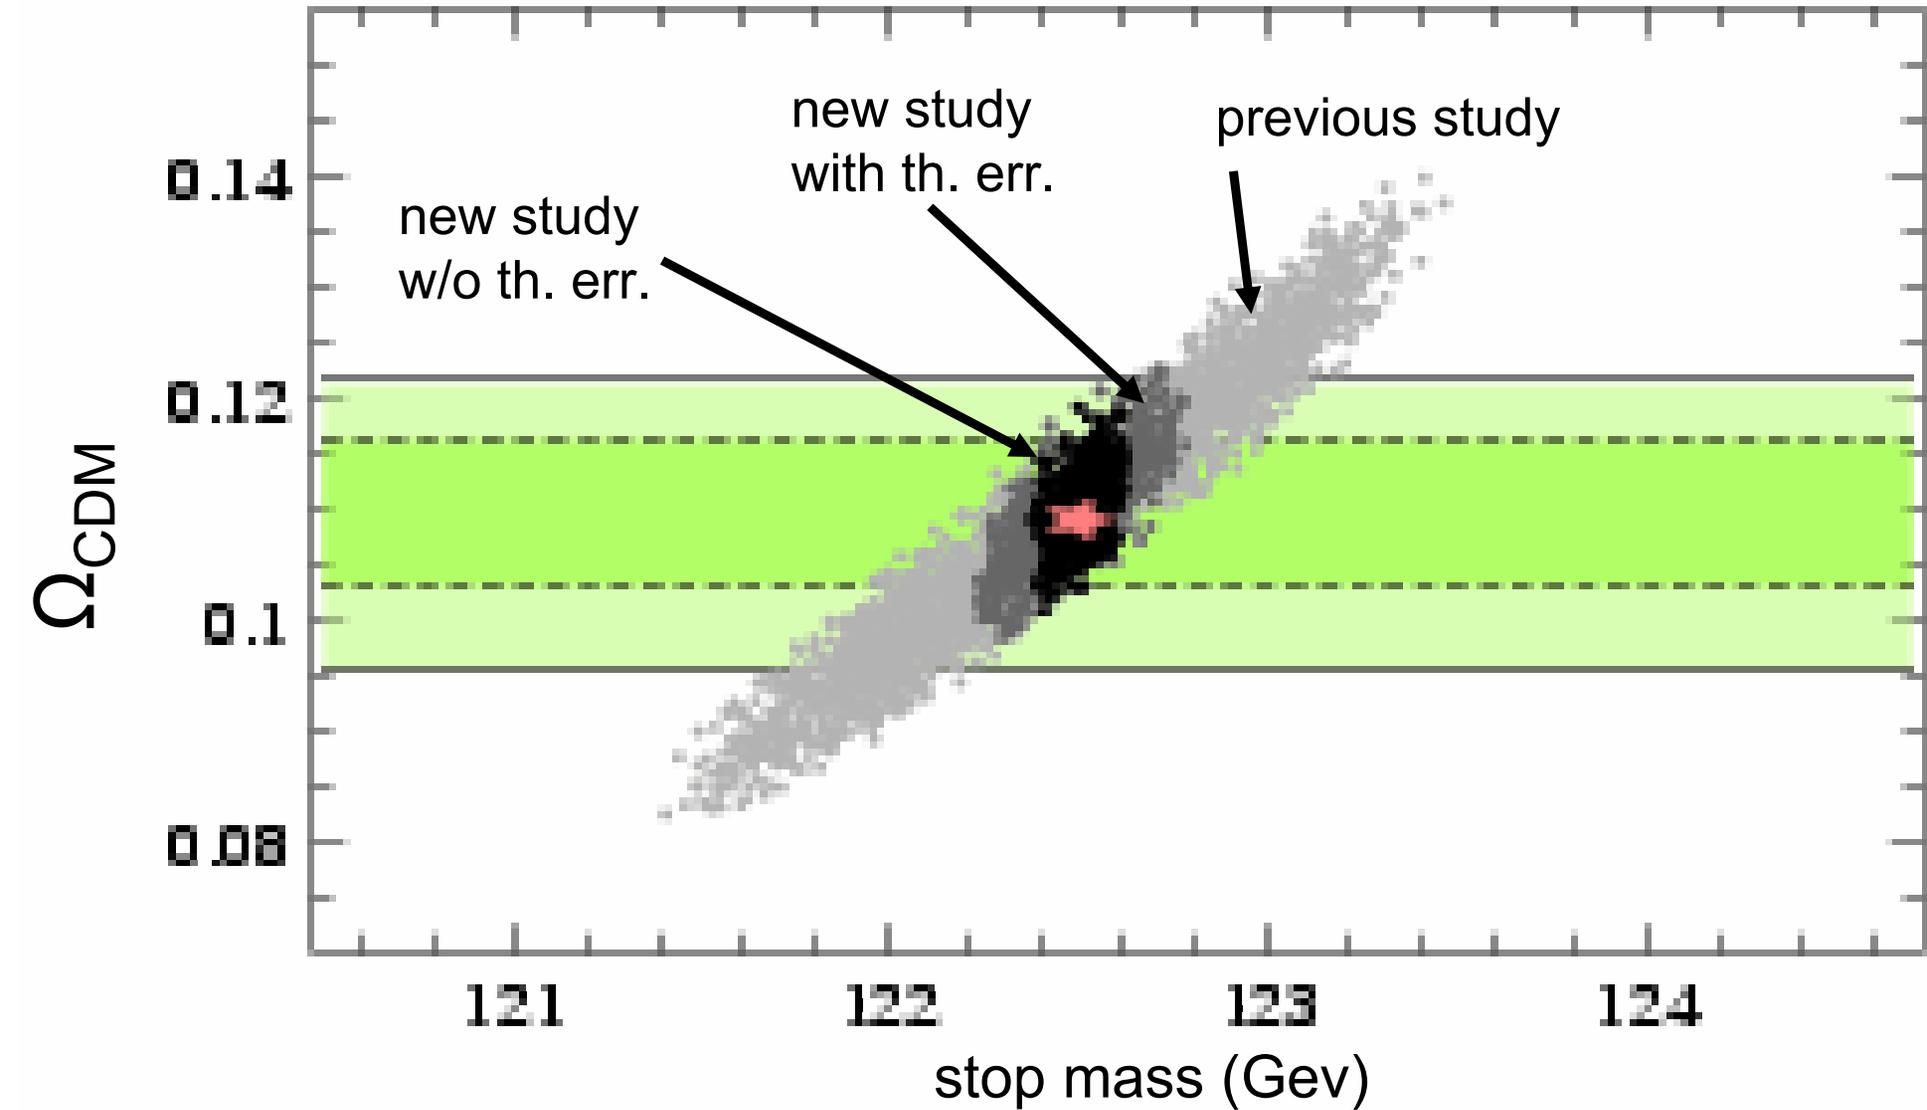

$$\sqrt{s} = 260 \text{ GeV}$$

$$\sqrt{s} = 500 \text{ GeV}$$

# Threshold Scan Method → C. Milstène SUSY session

**Dark Matter Prediction → C. Milstène SUSY session**

- From expected detection sensitivity (Morioka'95) to precision mass determination and Dark Matter prediction.
- $e^-$  beam polarization is important for mass and mixing angle determination,  $e^+$  polarization contributes in addition.
- Detector simulations improved, c-quark tagging as a benchmark for vertex detectors, also to find c-jets in multi-jet scenarios.
- Background depends on vertex detector design.
- Different detector descriptions e.g. SIMDET and SGV agree.
- Dedicated simulation with SPS-5 parameters.
- Simulations for small stop-neutralino mass difference, cosmology.
- Precision mass determination possible with a method using two center-of-mass energies, e.g.  $\sqrt{s} = 260$  and 500 GeV.
- Expected LC precision on  $\Omega_{\text{CDM}}$  comparable to cosmological (WMAP) measurements.
