

CALICE SiW Electromagnetic Calorimeter

Testbeam performance and results

Roman Pöschl
LAL Orsay

 Fermilab

ALCPG Workshop 2007

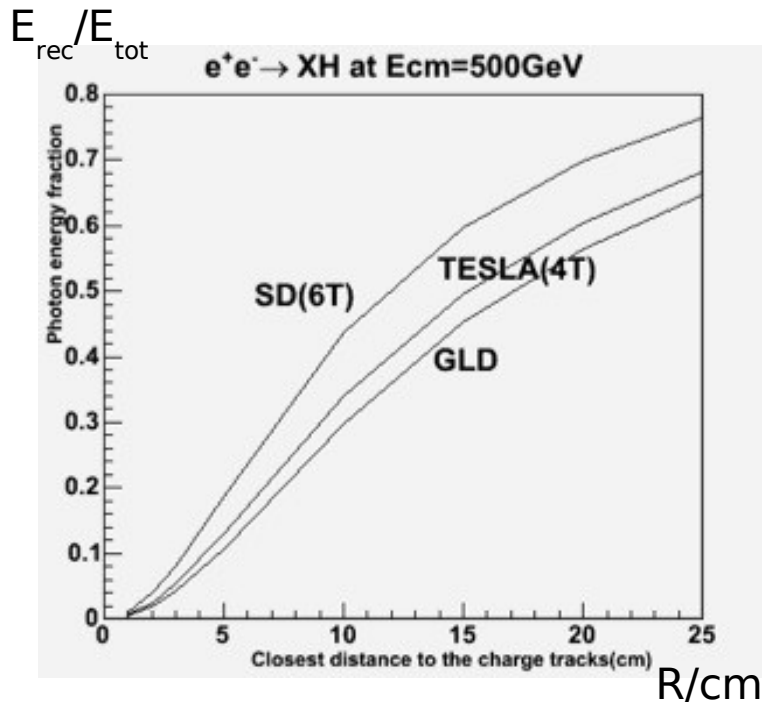

- An Ecal for an ILC Detector
- The Calice Collaboration
- SiW Ecal Prototype
- Testbeam Results
- Future Developments
- Summary and Conclusion

ALCPG/GDE Wordshop – ALCPG '07 Fermilab Batavia/Il - Oct. 2007

Ecal - Main Task

Photon measurement and photon/hadron separation

A. Miyamoto, LCWS05

“Known” basic tools: Large R and B
 If small R: Force created by Large B-Field
 might compromise detector stability
 Limit: $BR^2 < 60 \text{ Tm}^2$

Separation gets difficult if hadron and
 photon are within R_M
 Photon Energy gets assigned to close-by
 Hadron and vice versa

“Calorimetric” tools to improve
 photon-hadron separation?

Choice of Absorber Material - Tungsten vs. Iron

$X_0 = 1.8\text{cm}$, $\lambda_I = 17\text{cm}$

- elm./had separation:
keep X_0 / λ_I small

$X_0 = 0.35\text{cm}$, $\lambda_I = 9.6\text{cm}$

- Molière Radius for W: $R_M = 0.9\text{cm}$
- Cell Size need to match R_M !
- effectively a factor ($1 + \text{Gap} / 2.5\text{mm}$) more
- technology challenge: thin readout gap

Iron

Tungsten

Calorimeter R&D for the ILC

- ~230 physicists/engineers
from 12 Countries 3 Regions
- Integrated R&D effort
- Benefit/Accelerate Detector Development due
to common approach

Projects within Calice

First generation prototypes

- W-Si **ECAL** almost complete, in use in testbeam
(European Project)
- W-Scintillator strip **ECAL** in construction,
test beam @DESY , **Spring 2007**
(Asian Project)
- Tile **HCAL** with SiPM (MEPHI/Pulsar) r/o largely ready
and in use in testbeam
- Digital **HCAL** in plan
(Advanced) Effort in North America
Recent start up of European Project
- **Tail Catcher** and **Muon Tracker TCMT** (North America)

Projects benefit from

Common DAQ

Common Software

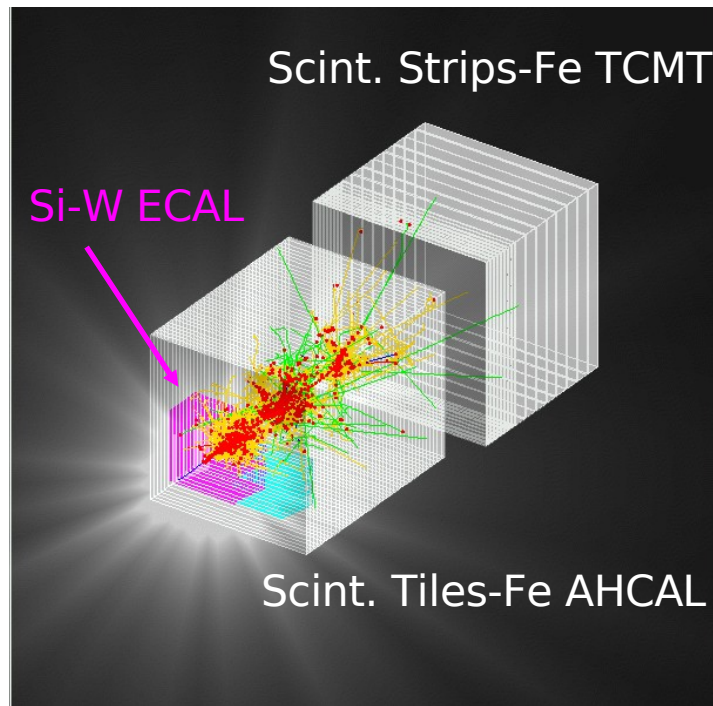

Common infrastructure, e.g. DESY testbeam

Common testbeam planning

The Calice Mission

Final goal:

A highly granular calorimeter optimised for the Particle Flow measurement of multi-jets final state at the International Linear Collider

Intermediate task:

- Build prototype calorimeters to
- Establish the technology
 - Collect hadronic showers data with unprecedented granularity to
 - tune clustering algorithms
 - validate existing MC models

6

Ecal Prototype - CALICE Collaboration

The ECAL prototype

- W as absorber material
- Signal extraction by “Silicon Wafers”
- Extreme high granularity
1x1 cm² cell size
- Detector is optimized for particle separation

Alveolar structure & Slab

- Design and fabrication of **alveolar structures** with associated moulds
 - Alveolar structures : 3 / 3
- Design and fabrication of **30 type H structures** with associated moulds
 - H with W = 1.4 mm : 10 / 10
 - H with W = 2.8 mm : 10 / 10
 - H with W = 4.2 mm : 10 / 10

Detector slab

Courtesy of J.C. Vanel LLR

Front-end PCB

6 active wafers

Made of 36 silicon PIN diodes

216 channels per board

Each diode a 1 cm²square

2 calibration switches chips

6 calibration channels per chip

18 diodes per calibration channel

12 FLC_PHY3 front-end chip

18 channels per chip

13 bit dynamic range

Line buffers

To DAQ part

Differential

14 layers

2.1 mm thick

Made in korea

Ecal in Testbeam @ CERN

... and indeed it can separate particles !!!
Particle distance $\sim 5\text{cm}$ – No confusion!!!!

CALICE Testbeam Data Taking

CALICE collaboration is preparing/performing large scale testbeam
Data taking in Summer 2006/2007

Testbeam Setup at CERN 2007

Slabs slit into
alveolas

Data taking 2006 2/3 equipped Ecal
Data taking 2007 (nearly) fully equipped Ecal

CALICE - CERN Data taking 2006/2007

~200 Millions Events in 'Physics' Runs

+

O(50 Mio). Muon Calibration Events)

~90% of the statistics collected with SiW Ecal included

Data management and processing by using the grid

ECAL (relative) calibration 2006

- Statistics ~18M events
- Taken with another experiment upstream → wide spread muon beam
- Procedure:
 - reject noise with a fixed cut at 25 ADC counts (~0.5MIP)
 - selection of MIP-like tracks : $15 \leq N_{\text{hits}} \leq 40$, in a 2 cm tower
 - fit with a Landau convoluted with a Gaussian

Calibration Constants

→ only 9 dead channels:
1.4‰ !!

→ 6403/6471 : 98.9% convergent fit.

→ 18/6471 needed a special treatment because of high noise.

→ 14/6471 have been calibrated using signals in adjacent pads.

→ One wafer (=36 cells) with a relative calibration : appears to be not fully depleted, $0.517 \times$ normal signal !!

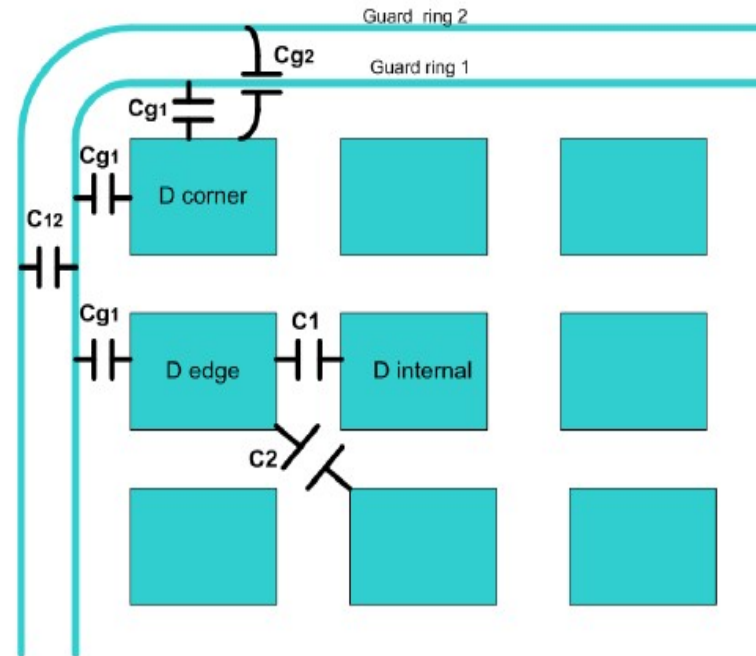

A.M. Magnan LCWS07

Not yet perfect -Odds observed during operation

- “Square events”

- cross talk between guard rings and pixels

A.M. Magnan LCWS07

Ecal Energy Resolution I

Dips in energy measurement by inter wafer gaps (needed for isolation)

Absolute calibration by comparing E_{dep} on MIP level with beam energy

Need to take geometrical acceptance into account

Energy Resolution II – Results for 2 models of Sampling Fraction

$$\frac{\Delta E}{E} (\%) = \frac{17.7 \pm 0.07}{\sqrt{E \text{ (GeV)}}} \oplus (1.1 \pm 0.08) \quad (\alpha_1, \alpha_2, \alpha_3) = (1, 2, 3)$$

$$\frac{\Delta E}{E} (\%) = \frac{17.1 \pm 0.07}{\sqrt{E \text{ (GeV)}}} \oplus (0.5 \pm 0.15) \quad (\alpha_1, \alpha_2, \alpha_3) = (1.1, 2, 2.7)$$

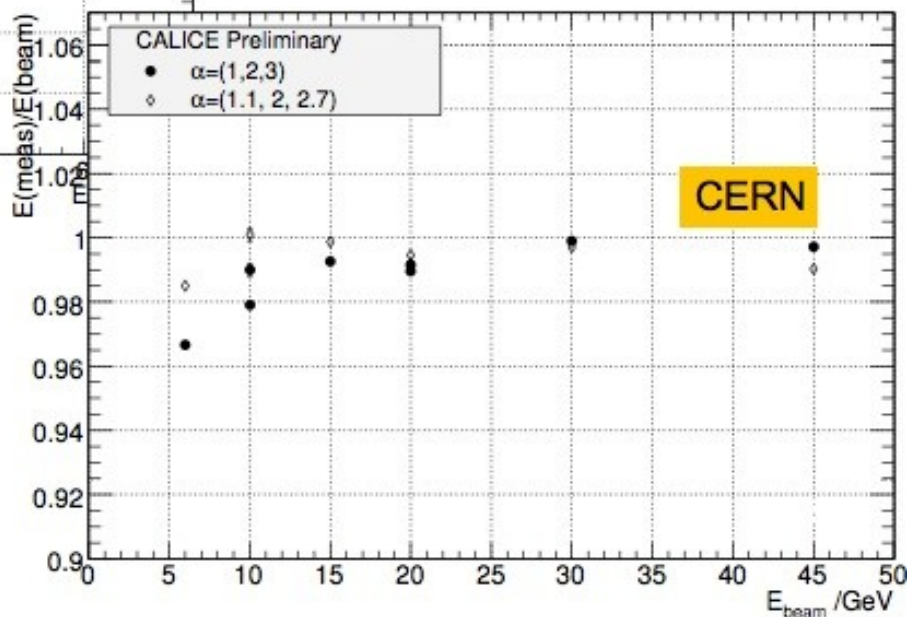

Statistical Term independent of “Sampling Factors”
 Good description by Monte Carlo – Mokka/G4
 Correct weighting under investigation

Linearity

High Energy Points
measured at CERN
Summer/Autumn 06

Low Energy points
measured at DESY
May 06

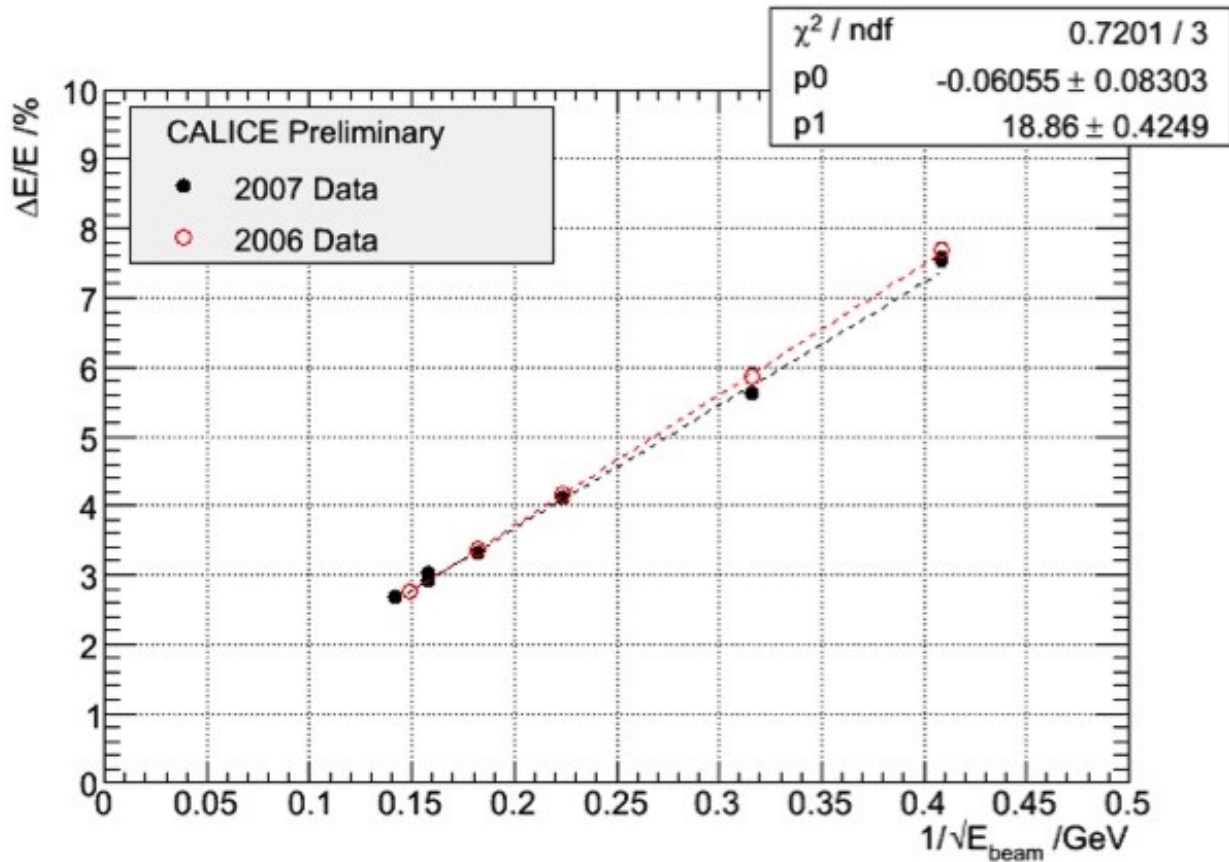

Linearity better than 2% -
Deviations towards low energies might be coupled
to worse beam quality -> under investigation

Towards Analysis of 2007 Data I

Energy Resolution

Results obtained during [monitor phase 2007](#)
Calibration for 2006 applied

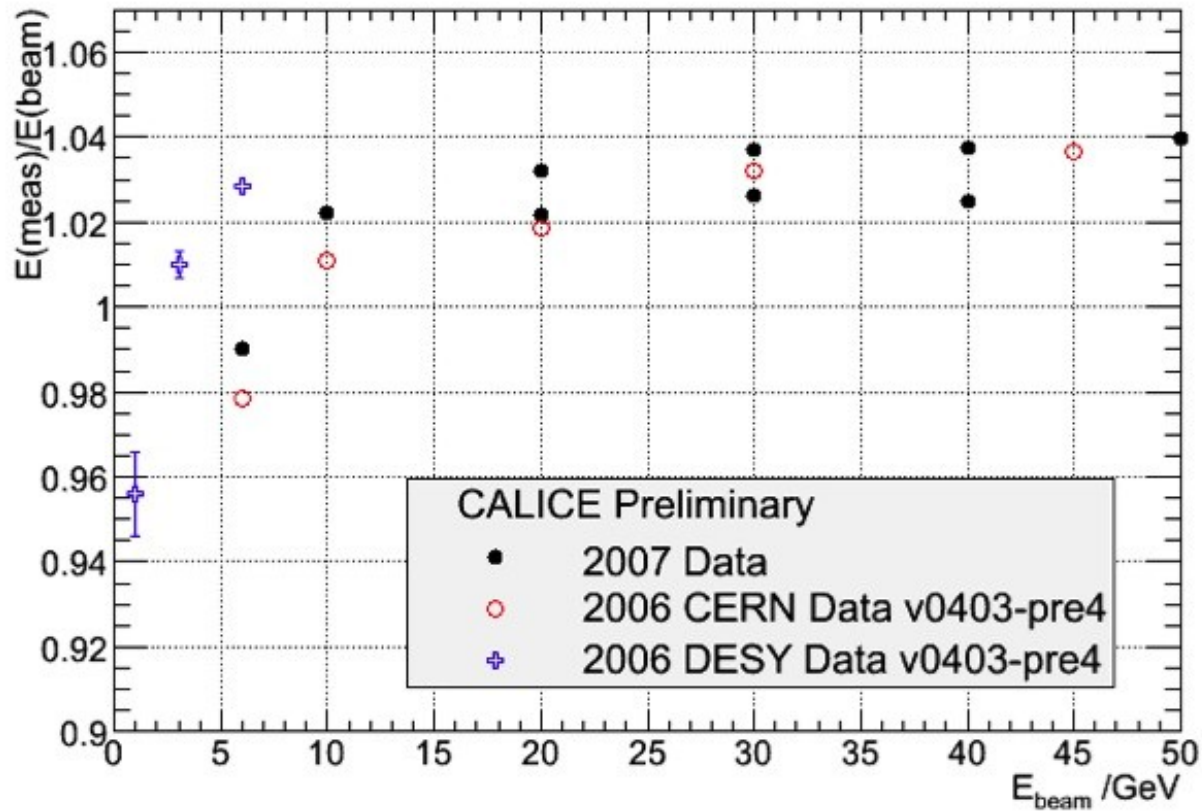

2006 and 2007 are compatible
Details to be understood

Towards Analysis of 2007 Data II

Linearity

Results obtained during [monitor phase 2007](#)
Calibration for 2006 applied

2006 and 2007 data are compatible
Details to be understood

D. Ward

Towards an ILC Detector – Interleaved Electronics Test 2007

Calorimeter Electronics to be interleaved with layer structure

Do high energetic showers create signals directly in electronics ?
If yes, rate of faked signals ?

Special PCB in Ecal Prototype during CERN 07 Testbeam – Experimental Setup I

Test PCB
- equipped with
PHY3 Chip Set

Prepared Slab
- W dummy
- capton and paper
for electrical shielding

Usual Slab

Picture courtesy of B.Lutz

Special PCB in Ecal Prototype during CERN 07 Testbeam – Experimental Setup II

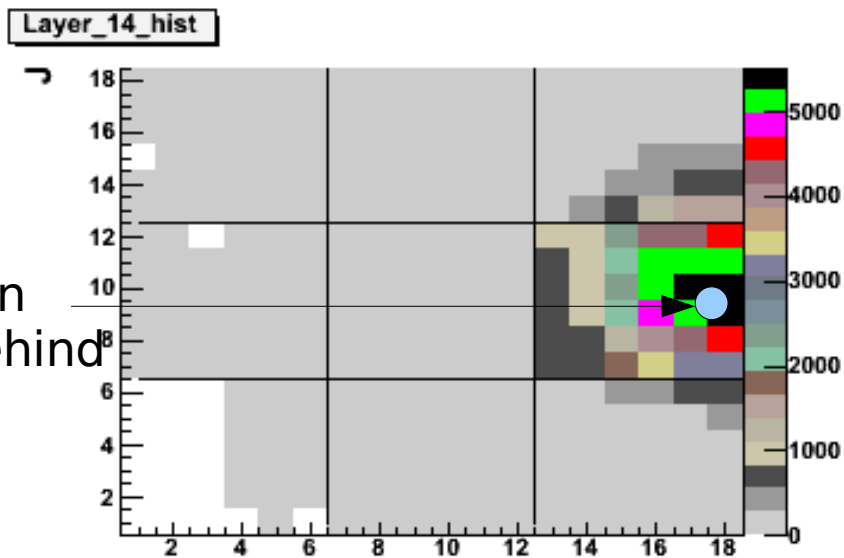

- PCB positioned at \sim shower maximum
- Schematic view of test PCB - 'Expect' signals from 72 pads, $4 \times 18 = 2$ Wafer

- $7 \cdot 10^6$ Triggers with 90 GeV Electrons ($- 1 \cdot 10^6$ with 70 GeV Electrons)
At least 250 K at each scanning point
Today: Analysis of 10k Events per analysed run

Activity in Special Layer

70 GeV e⁻ - Beam Impact at nominal center of Chip 1 (-8.33,0) cm

Small Activity in 'Special' Layer

Result indicates that an ILC detector can be operated with interleaved electronics

Projection of
Chip I position
onto layer behind
special layer

Summary and Outlook

- SiW Tungsten Ecal with up to 9400 cells operated successfully during testbeam campaigns 2006 and 2007
- Stable operation with only 1.4% dead cells
- Important hints for design of ILC Calorimeter e.g. Square Events
- Energy resolution well described by MC
Linearity $O(2\%)$
- For a full overview on results see LCWS Calorimeter Sessions
2 papers on 2006 data under preparation
- First analysis of test with interleaved electronics revealed no show stopper for this technology
- More data/further tests on future electronics at Fermilab test beam start in spring 2008
