<b>Work Package Details</b>	
<b>Work Package Title</b>	Power Systems
<b>Short keyword title</b>	<i>(For PMO use)</i>
<b>Abstract</b>	<p>The design concepts established under the Reference Design Report (RDR) permitted a “first-cut” estimate of the RTML magnet power systems cost. Needed now are engineering and design details to move beyond the concepts.</p> <p>This Work Package covers the design and documentation of DC and pulsed magnet power systems and their associated controls for the E+ Source Transport Line. The objectives are to define the interfaces, design the systems, estimate the costs, and document the magnet power systems in a rigorous manner that permits later material acquisition and installation.</p>

UNFUNDED - FOR PLANNING PURPOSES ONLY

**Work Package Details (Continued)**

**Major tasks and objectives**

There are 2,200 power systems. The power system designs will accommodate the interfaces of optics, magnets, controls, and facility. Interfaces include E+ Source Transport Line physicists, magnet engineers, global control engineers, and facility designers. PCD will develop magnet power systems for the E+ Source Transport Line to satisfy the requirements for control, ring tuning; the physical constraints of the tunnel and service building layouts, constraints on tunnel heat load, and reliability requirements for a viable power distribution infrastructure. The Designer will explore options to provide a cost-effective design meeting the above criteria and carry out the necessary EDR engineering and design.

In conjunction with the Conventional Facilities Systems (CFS) group, define the space needed to accommodate power supplies in the service buildings. As part of this effort, optimize the magnet-power supply interface, and power supply locations to minimize the cable plant, its attendant cost, and tunnel heat loading.

The Spin Rotator and several other magnets require currents greater than 500A. Air-cooled conductors connect these magnets to their power supplies. Air-cooling necessitates paralleled conductors, in sizes typically larger than 750kcmil. Designer should consider the use of water-cooled cable for these circuits to reduce the cable quantity and the cable tray requirements.

All power system specifications will include the requirements for power, control, stability, and reliability.

The E+ Source Transport Line might also employ non-fast kicker magnets requiring somewhat conventional pulsers. Because the pulser quantity is small, their impact on the cost and value engineering to be as great as for the DC magnet power systems. However, they might have complex control, layout, and reliability issues. Their costs need capture; therefore, this Work Package includes this work.

Work with magnet design personnel, optics personnel and the Cost Account Manager to minimize the variety of power systems used in E+ Source Transport Line and standardize the power supply types with those in other ILC areas. Throughout the execution of the EDR, PCD will update and refine the magnet power system cost estimates and devise a project execution plan for acquisition of the power systems consistent with ILC milestones and commitments.
