

Distributed RF-source Scheme (DRFS) First Design

Shigeki Fukuda (KEK)

- Introduction
- Possible RF-source
- General Cost Consideration
- Klystron Design Consideration
- Modulator Design Consideration
- Power Distribution
- Sketch of DRFS
- Summary

Currently proposed schemes and discussion

- BCD-2-tunnel scheme
 - Well accepted plan which has been discussed in GDE and basically good plan for Questionnaire
 - Cost cut-down is required
- Alternative scheme plan (at DUBNA)-Single tunnel
 - DESY type single tunnel scheme
 - Shallow tunnel scheme (@DUBNA)
 - RF Cluster Scheme
 - Distributed RF Scheme (at LCWS08@Chicago)

Distributed RF-source Scheme (DRFS):

an RF source feeds power to a few cavities

Motivation

- Currently various single tunnel schemes are discussed to cut down the cost of ILC and new scheme has another possible scheme.
- Very simple configuration and simple control
- Cost cut-down is expected for the large scale system such as ILC by the mass production.
- Historically this scheme was discussed at Snowmass before but not adopted to ILC RF scheme.
- After LCWS08, modeling of DRFS has been studied.

Comparison with other Scheme

BCD and alternative scheme proposed

TotalCost					

General Cost Consideration(1): Cost balance between BCD and DRFS

Equivalent cost of 1 RF unit of DRFS against BCD 1 Unit=26 cavities (of 650 Units)

RF Source 0.26

Modulator 0.44

PDS

0.30

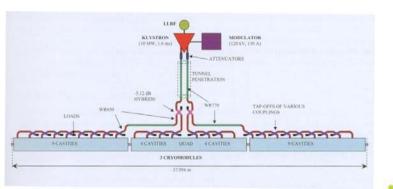

1.0

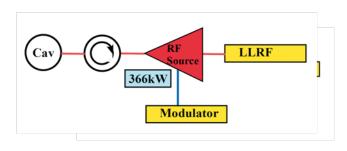

Total

=31.5MV/m*1.03m*9mA=293kW Operation at 80% Saturation=366kW

1 Cavity required power

1/26=0.038 @1 RF cavity @BCD

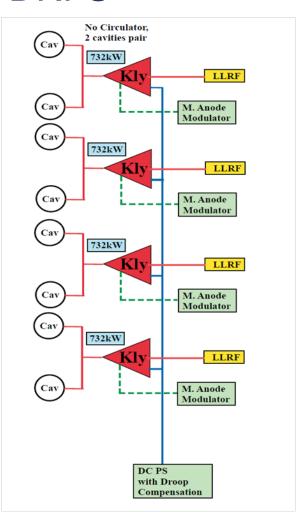

Total amount

X 26 X 650 =16900

General Cost Consideration(2): Most Likely Plan for DRFS

- Circulator elimination by power feeding to 2 cavities
 from one klystron. Output power is 732kW.
- Modulated Anode Klystron (MAK) is adopted.
- Anode modulation pulser does not need the high power and cost efficient pulser is manufactured.
- DC Power Supply is common for 26 cavities and voltage drop during the pulse is compensated with appropriate circuits at the level that LLRF can feed back.
- It is easy to suppress the collector power dissipation without rf in MAK by adjusting the modulated anode voltage.
- Total Number of MA-Klystron=8000
- Total Number of M. Anode Modulator=8000
- ■Total Number of DC PS =650

General Cost Consideration(3):

Balanced Cost between DRFS and BCD

BCD

RF Source (for 26Cavities)

Modulator

PDS

Total 1.0

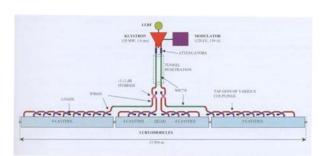

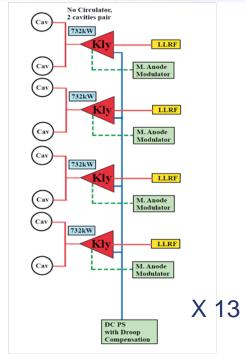

DRFS

Cost for 1 klystron unit @BCD=1/13=0.077

"Target Cost"

Since DRFS is a complete single tunnel plan and extra contribution to RF source is expected by a simple CFS.

Klystron Design for DRFS

Design Parameters

• Frequency 1300MHz

Output Power 750kW

RF pulse width 1.565ms

Beam pulse width 1.7ms

Average RF power 6kW

Peak beam voltage 62kV

Peak beam current 21A

Beam Perveance 1.36mP(@62kV)

Gun Perveance 1.735mP (@Ea-k=53kV)

DC Gun Voltage(A-B) >64kV

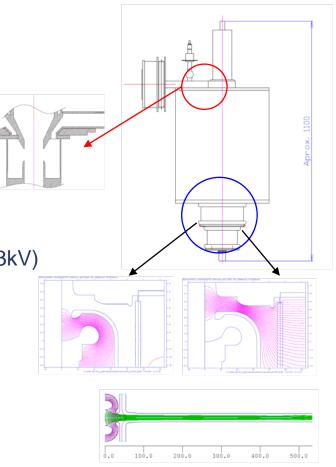

Tetrode MA-type

Electromagnetic Focusing

Water cooling

• Total length 1.1m

Weight 70kg

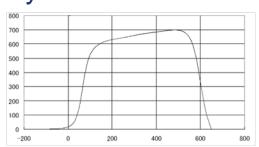

Design Results and Remarks

- Cavity Numbers6
- Higher harmonics cavity yes
- Efficiency 60%
- Input power @ saturation <40W
- Electric field 54.7kV/m(A-K)
- Electric field 63.1kV/m(A-B)
- Cathode Loading
 2.1A/cm²
- Focusing Magnetic Field:

Magnet is completely axial symmetric

20A, 80V

Cost Consideration for the MAK

In order to manufacture cheaply, cost cut-down efforts as follows are required.

- 9000 tubes are manufactured during the 5 years (1,800/year) and 400/year manufacturing is follows as the maintenance.
- Company proceeds up to the tube baking. (Company needs to invest the baking and brazing furnaces)
- Tube processing is performed at the ILC site utilizing the ILC modulator.
- Common parts of the tube : employing hydro-forming
- Cavity tuning: auto tuning introducing the tuning machine
- No ion pump: getter in the tube
- No lead shield in the tunnel of the ILC
- Gun insulation ceramic is operated in the air. Corrugated ceramic to make a longer insulation length is considered.
- Focusing magnet is relatively high cost, and we need to look for the cheapest manufacturer in the world. Since it is completely axial –symmetric, lathe machine and auto winder in the simple manufacturing way is expected.
- (R&D) Cooling Cost Saving by Utilizing Potential Depressed Collector
- RF Source cost =0.039@1 RF unit cf. 0.020 (RF source target price)

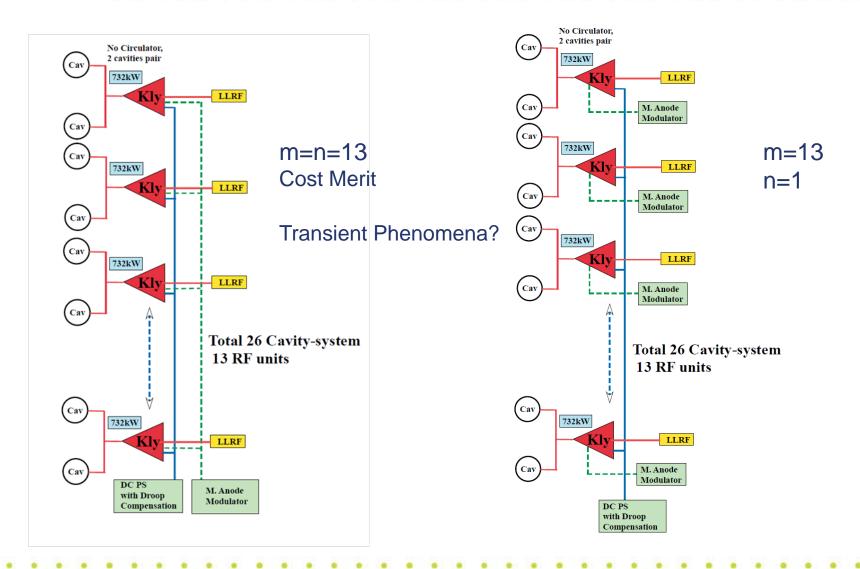

Modulator Design

Key Features of Modulator Consideration in DRFS

- One RF unit feeds power to 2 cavities.
- Modulated Anode Klystron is driven by DC power supply and modulated anode pulser.
- DC power supply feeds the voltage and current to "m" RF units. If m=13, this scheme corresponds to BCD one unit.
- Modulated anode pulser gives the modulation pulse to "n" RF units. If n=1, an individual RF unit are driven by a M-A pulser. If n is not 1, it is necessary to check the total stray inductance and capacitance to affect the pulse transient phenomena.
- Cost is strongly depended on the choice of m and n.
- DC Power Supply uses 6.6kV electricity line and disconnection sw is introduced.

Modulator Design(2)

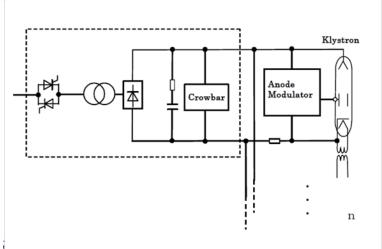

Tentative Cost Study of Modulator

Case of m=13, n=1

DC Power supply comprises of delta-star, step-up transformer, rectifier diodes, capacitors and crowbar circuit. (Is it possible to eliminate the crowbar?)

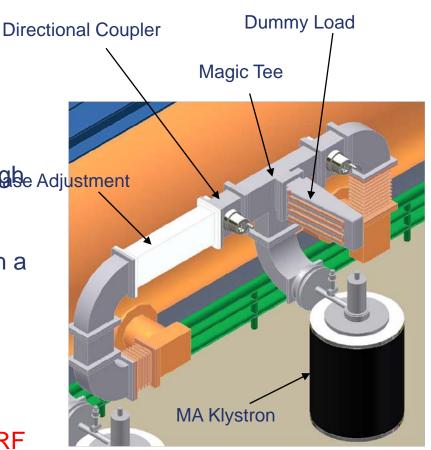

- Key point is how cheap the M anode pulser is designed and manufactured.
- M anode pulser employs oil tank and insulation ceramic output connects to klystron.
- Another issue is to eliminate IP power supply by employing the getter in the tube.
- Very simple filament power supplies specially designed for this purpose.
- Very simple coil power supplies specially designed for this purpose
- Eliminate the disconnection SW, which is related with the system redundancies.
 R&D of 6.6kV fuse-like disconnector might help the system reliability.
- Very simple control system such as a PLC in one DC P/S with EPICS control (ex).
- Modulator cost <u>=0.052@1</u> RF unit cf. 0.034 (RF source target price)

Power Distribution System

Very simple power distribution system is proposed in this scheme.

- No circulator
- Power divider employs magic tee with highe Adjustment isolation for space saving.
- One Phase-shifter with symmetric PDS between couplers or asymmetric PDS with a phase-fixed waveguide for cost saving
- 750kW RF is propagated in the dry air without any extra ceramic window
- PDS cost <u>=0.006@1</u> RF unit cf. 0.023 (RF source target price)

Comparison of Ilrf configurations

•	Baseline	Single tunnel	Klystron cluster	Single driver
No. of tunnels	2	1	1	1
LLRF unit	Service tunnel	Beam tunnel	Beam tunnel	Beam tunnel
Cavity/ rf unit	26	26	780	1 or 2
No. of vector sum	26	26	780	1 or 2
QI and power distribution control	Necessary	Necessary	Difficult	No need
No. of Ilrf cable /rf	~80	~80	~2,400	~3
Loop delay	~1 us	~1 us	~10 us	~0.3 us
Typical FB gain	~100	~100	~20	~1,000
Each cavity field flatness	Bad	Bad	Worse	Complete
Robustness	Good	Good	Not good	Better
Exception handling	Not easy	Not easy	Quite complicated	Easy

LLRF Summary (By Shin Michizono)

LLRF performance

- shorter latency results in higher FB gain (robustness)
- higher FB operation (aiming the FB gain of ~1000)

Operability

- -simpler cavity control (flat field obtainable near below quench without worrying about QI and P control scheme)
- LLRF diagnostics become possible even during luminosity operation.

HA/Robustness

- higher availability owing to the flexible selection of stand-by cavity

Exception handling

- No need for fast recovery (because each unit has small energy contribution)

Other advantages/disadvantages

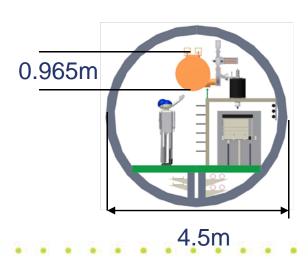

- Reduce the length of rf cables (less cost, less phase rotation)
- Omit fast optical link between IIrf board (for vector sum)
- Omit phase-shifter, tunable coupler in waveguide and cavity
- Need IQ modulator (in each rf unit) (but the devise is cheap)

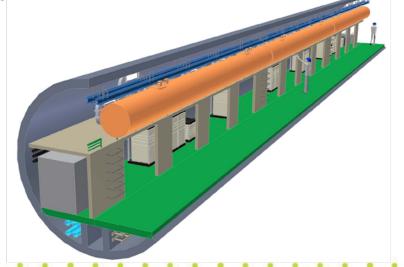

Rough Sketch for DRFS(I)

- Single tunnel layout. 4.5m diameter (like RDR beam tunnel)
- Cryomodule is hanged down from the top of the tunnel.
- RF sources are connected to cavities without circulator
- In this drawing, a modulator applies the voltage to two RF source. Working space are considered as shown in the drawing.
- Modulators, LLRF units and other electrical devices are installed in the shielding tunnel.
- There is a choice that the DC power supplies or chargers are concentrated for 13 units or more.

Layout of a modulated anode klystron is shown.

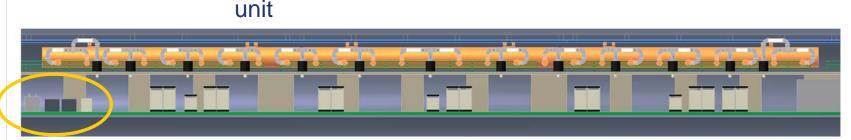

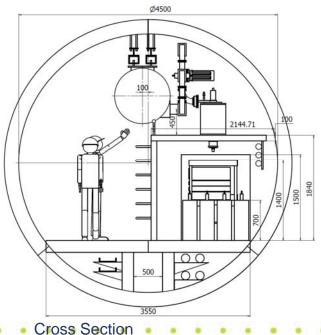

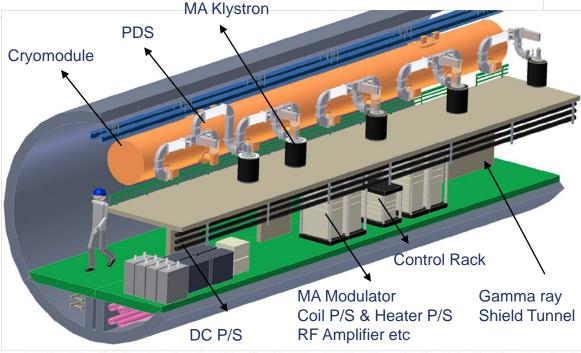

Rough Sketch for DRFS(II)

Sketch of 3-Cryo-module unit

6.6kV In & Rectifier Transformer Capacitor Bank, Bouncer

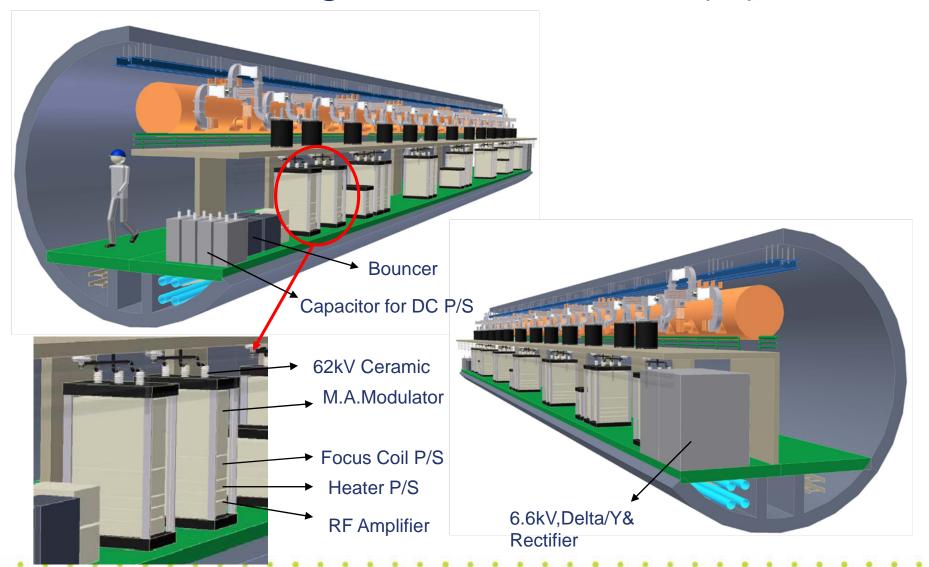

Rough Sketch for DRFS(III)
