

# Main Linac Integration

Chris Adolphsen

# Quadrupole Package

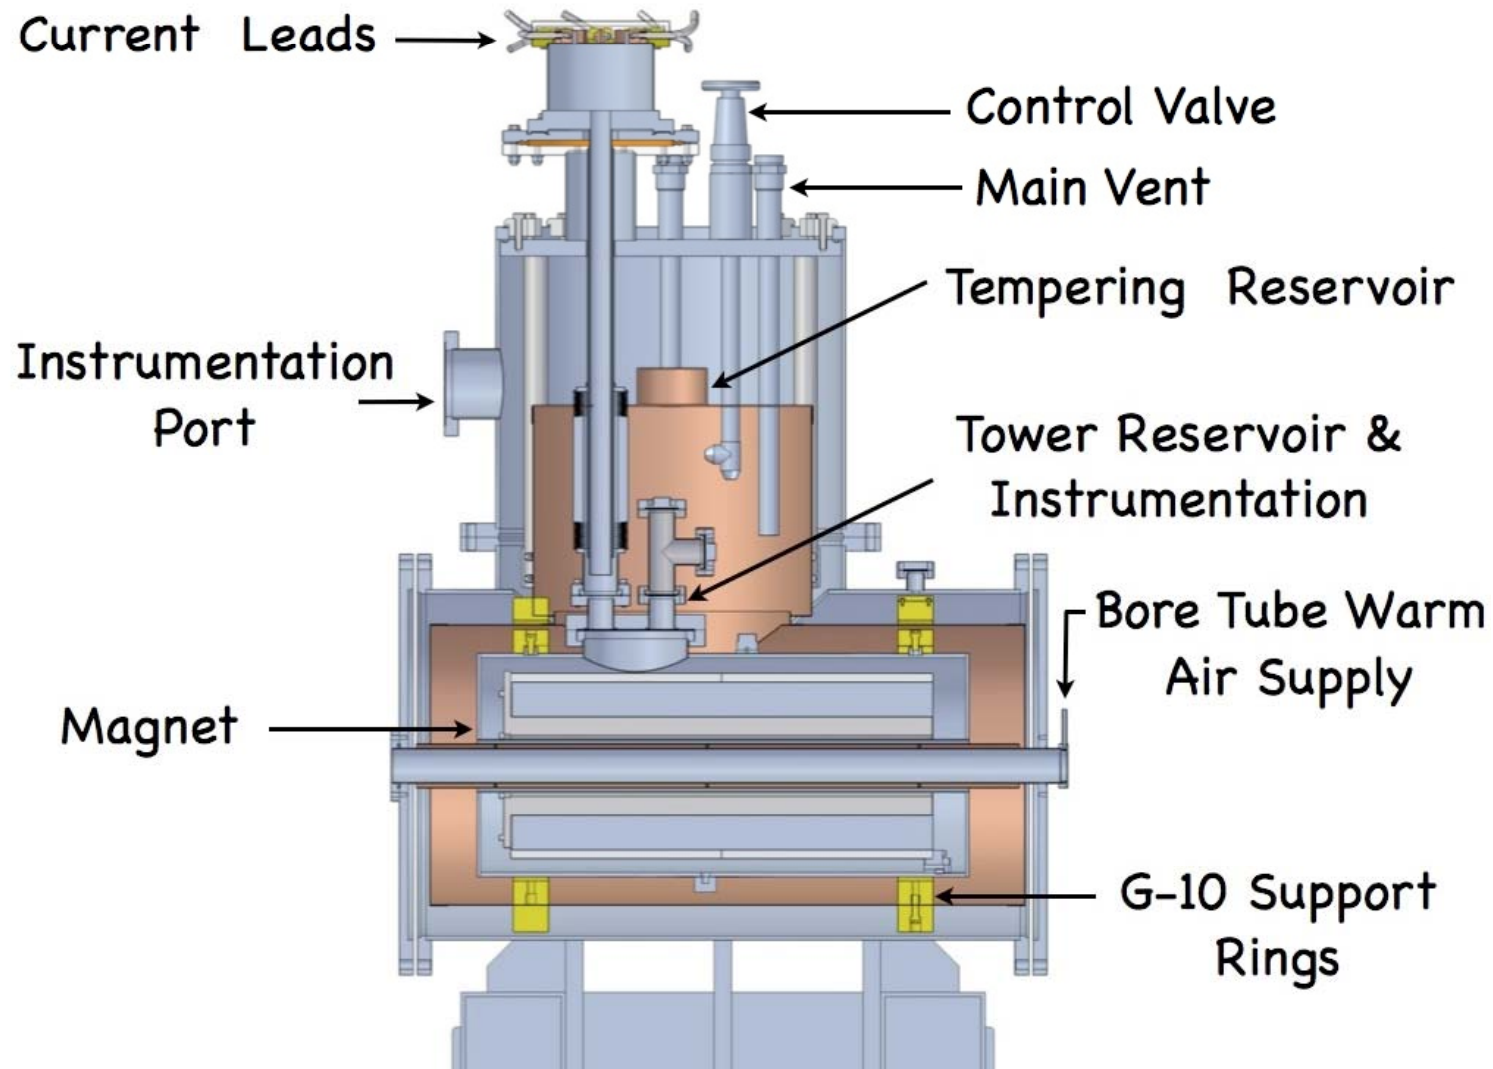

# Quad Field and Position Requirements

- Installation Requirements
  - Local alignment to the cryomodule axis – covered in N. Ohuchi specs
  - Long range (10 m to 10 km) – Kubo et al working on specs
- Fast Motion (Vibration)
  - Require uncorrelated vertical motion  $> \sim 1$  Hz to be  $< 100$  nm
  - Many measurements being done – data show spec can be met
- Slow Motion (Drift)
  - For dispersion control, want quad to stay stable relative to its neighbors at few micron level, day to day
  - Although slow ground motion is large, it is correlated over long distance range which makes its net effect small.
  - Also sensitive to cryo shielding temperature changes and tunnel temperature changes.
- Change of Field Center with Change in Field Strength
  - For quad shunting technique to be effective in finding the alignment between the quad and the attached bpm, quad center must not move by more than a few microns with a 20% change in field strength

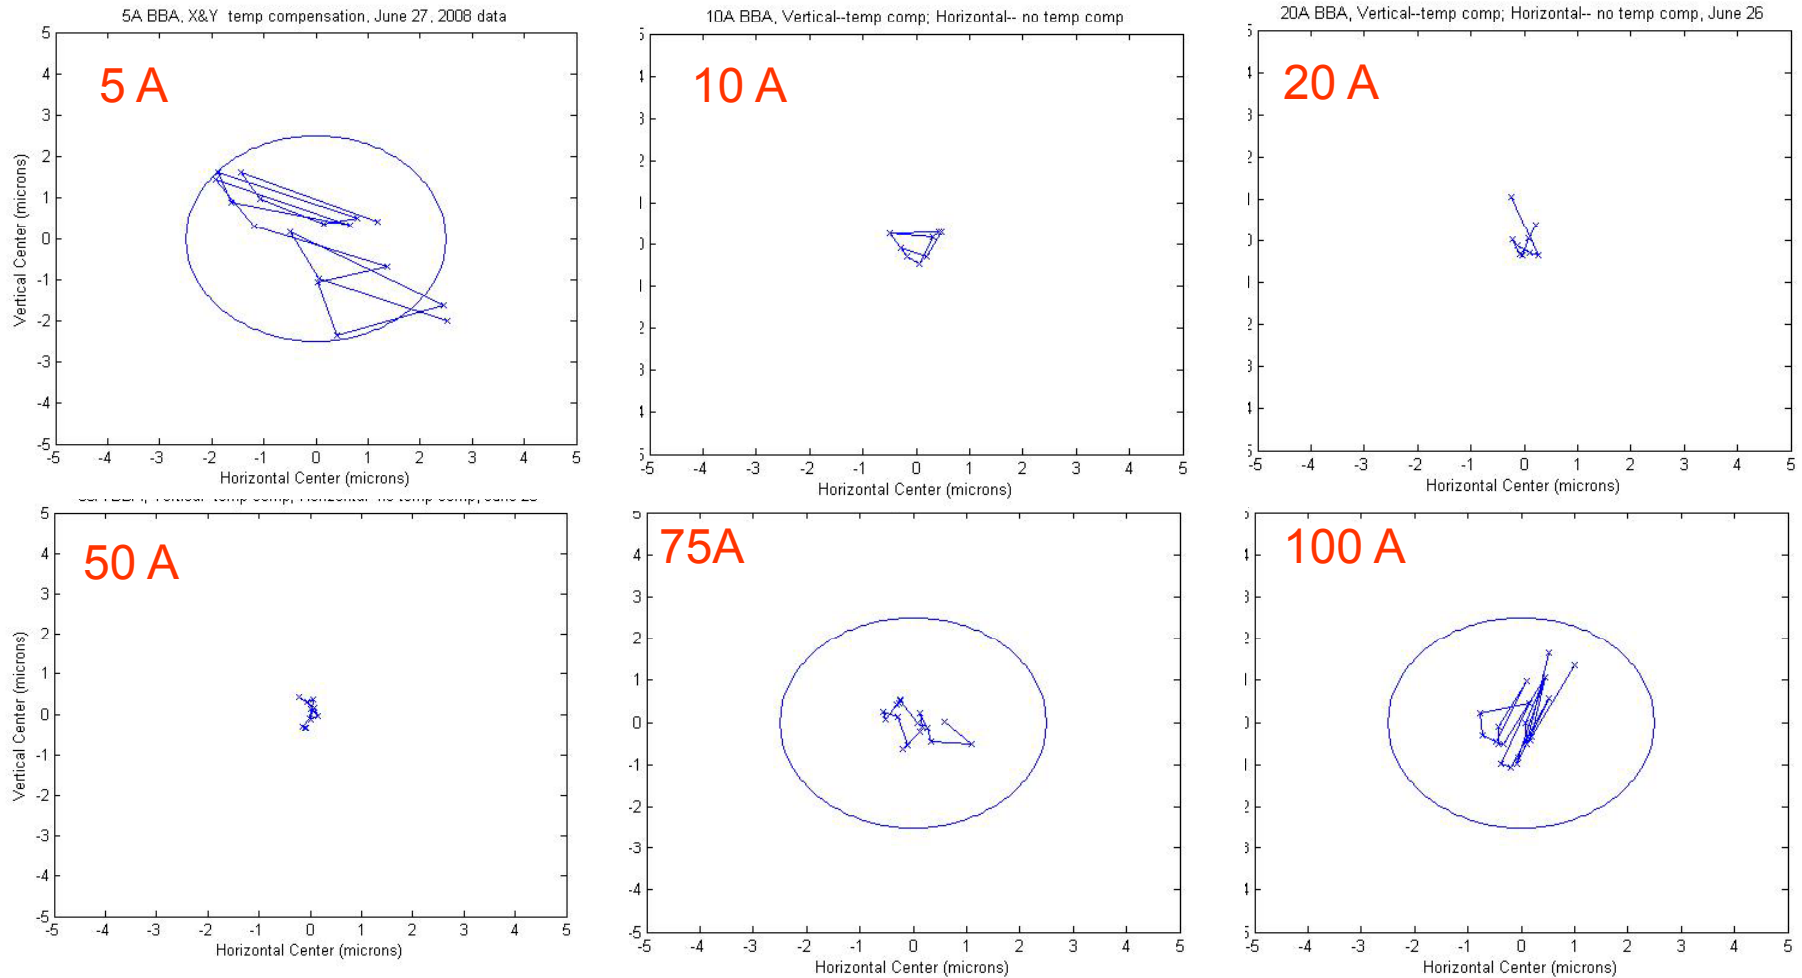

# CIEMAT SC Quad Test at SLAC

$\cos(2\phi)$ , 0.6 m Long, 0.36 T/A Quad + X/Y Correctors

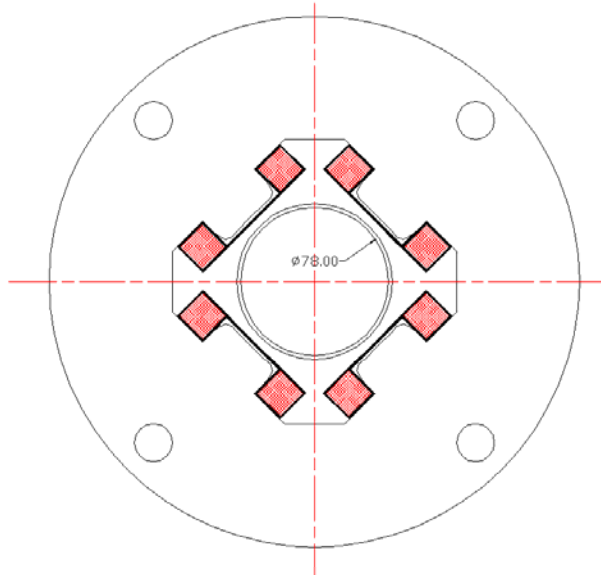

# Center Motion with 20% Field Change

Motion Shown in Plots with  $\pm 5 \mu\text{m}$  Horizontal by  $\pm 5 \mu\text{m}$  Vertical Ranges

# FNAL SC Quadrupole Design

A “superferric” design was chosen where saturated iron poles form a substantial part of the magnetic field in the quadrupole aperture.

## QUADRUPOLE MODEL PARAMETERS

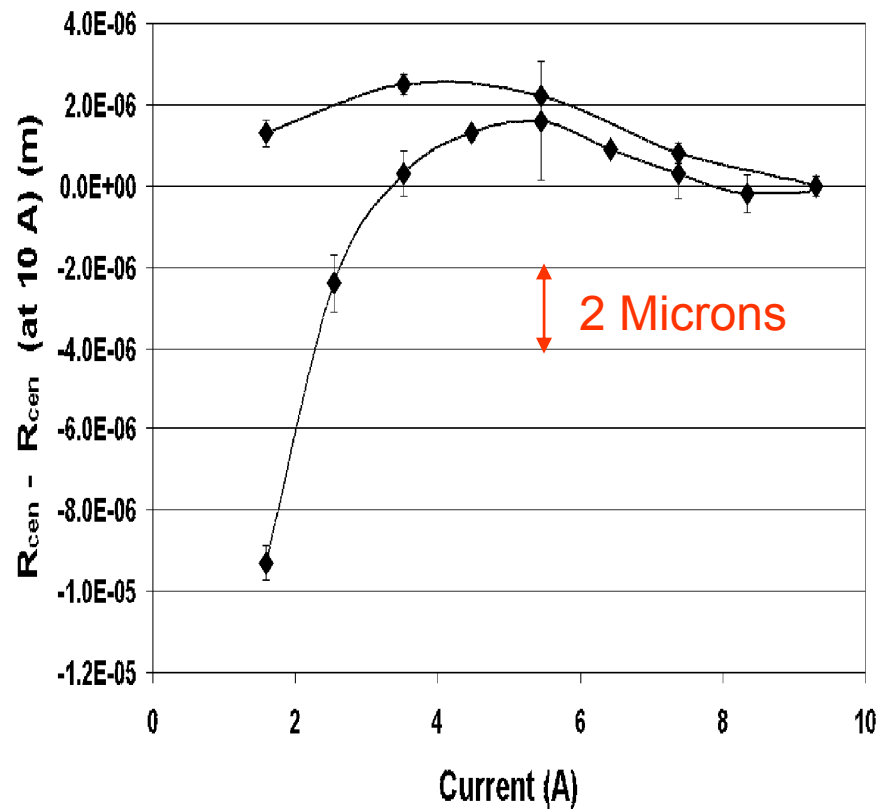

Parameter	Unit	Value
Peak current at 36 T gradient	A	100
Magnet length	mm	680
NbTi superconductor diameter	mm	0.5
Superconductor filament size	$\mu\text{m}$	3.7
Superconductor critical current at 5 T and 4.2 K	A	200
Coil maximum field	T	3.3
Quadrupole coil number of turns/pole		700
Yoke outer diameter	mm	280

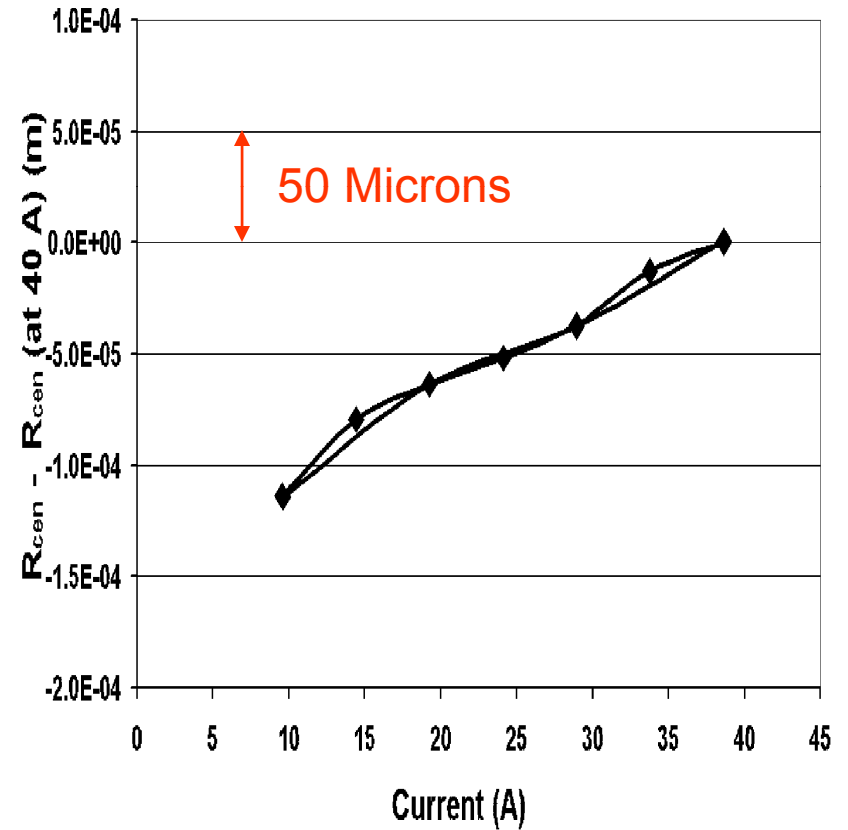

V. Kashikhin

# Center Motion with Field Change

Magnet center stability vs current

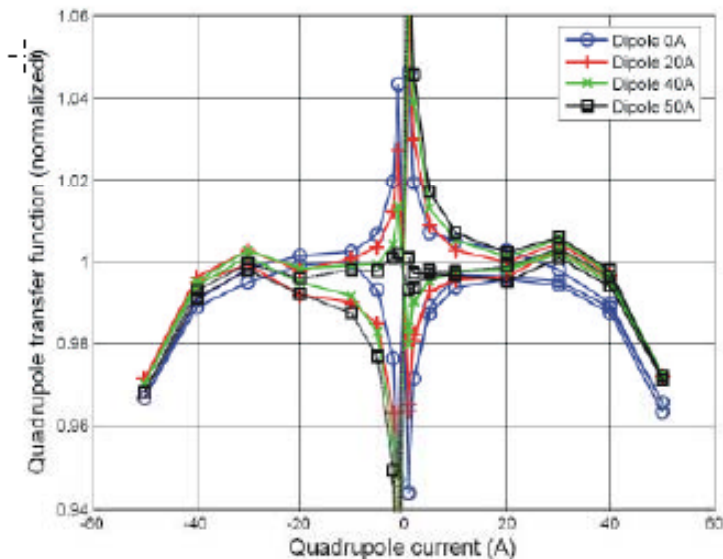

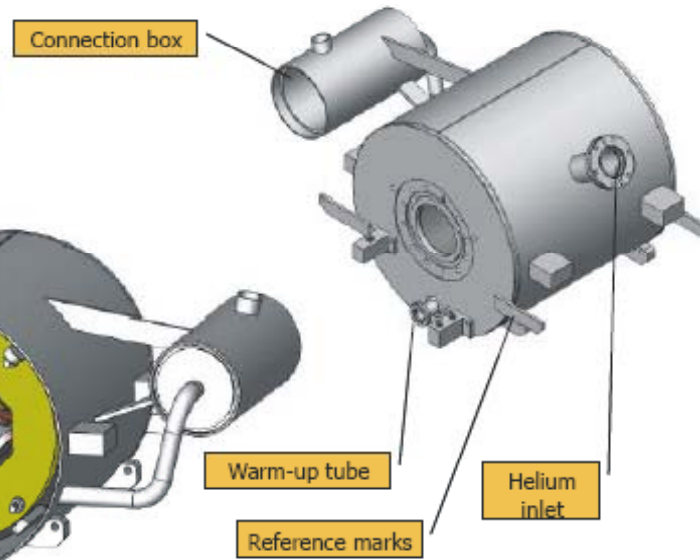

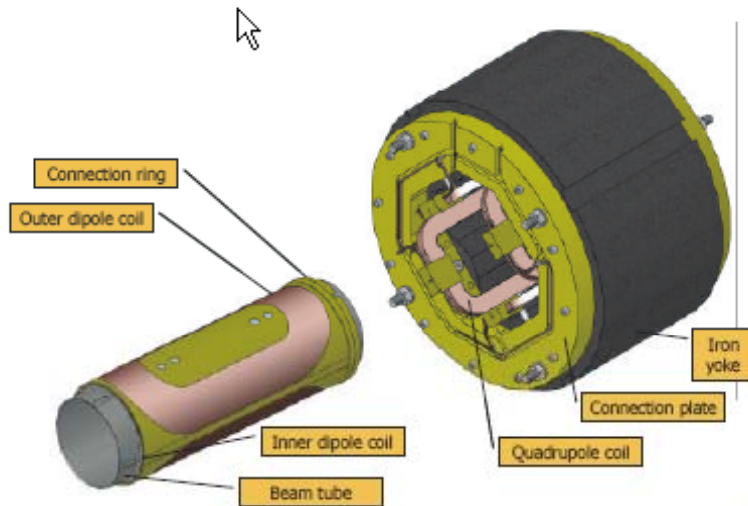

Magnet center stability vs. current

# XFEL Prototype Superferric 6 T SC Quad

- Design according to TUEV pressure vessel rules
- Copperized beam tube
- Sliding supports on linear bearings
- BPM attached on endplate

In first prototype, see significant, asymmetric magnetization plus dipole influence on quad

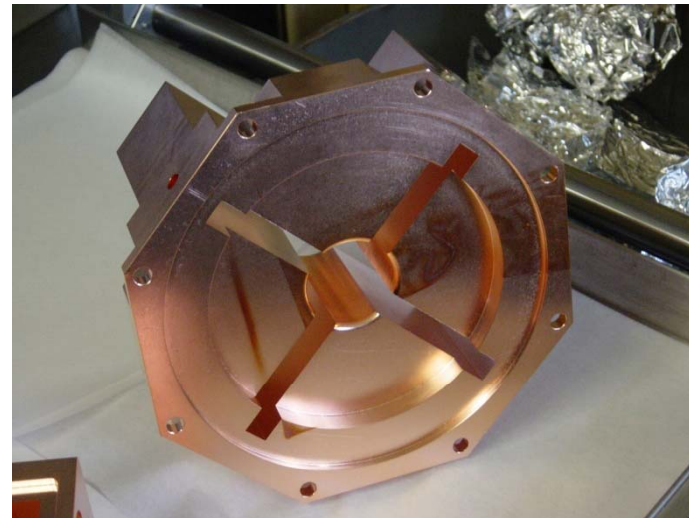

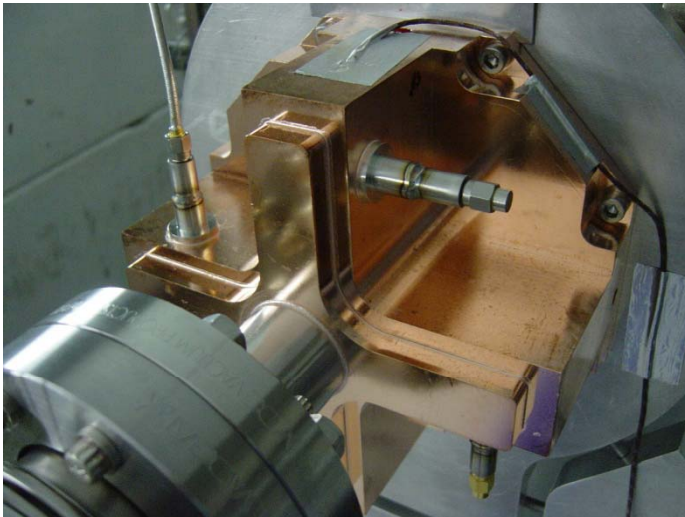

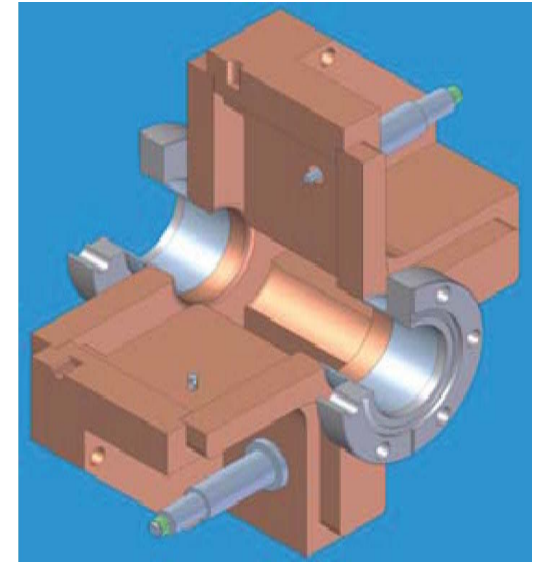

# RF BPMs

- Require
  - 1 micron level single bunch resolution
  - Ability to resolve bunch-by-bunch positions with 300 ns (150 ns) bunch spacing
  - Cleanable design so does not contaminate cavities
  - Readout system that is stable to 1  $\mu\text{m}$  on a time scale of a day for a fixed beam offset up to 1 mm.
- Linac Prototypes
  - SLAC half aperture S-Band version for ILC
  - FNAL L-Band version for NML/ILC
  - SACLAY L-Band version for XFEL/ILC
  - Pusan National University / KEK TM12 version

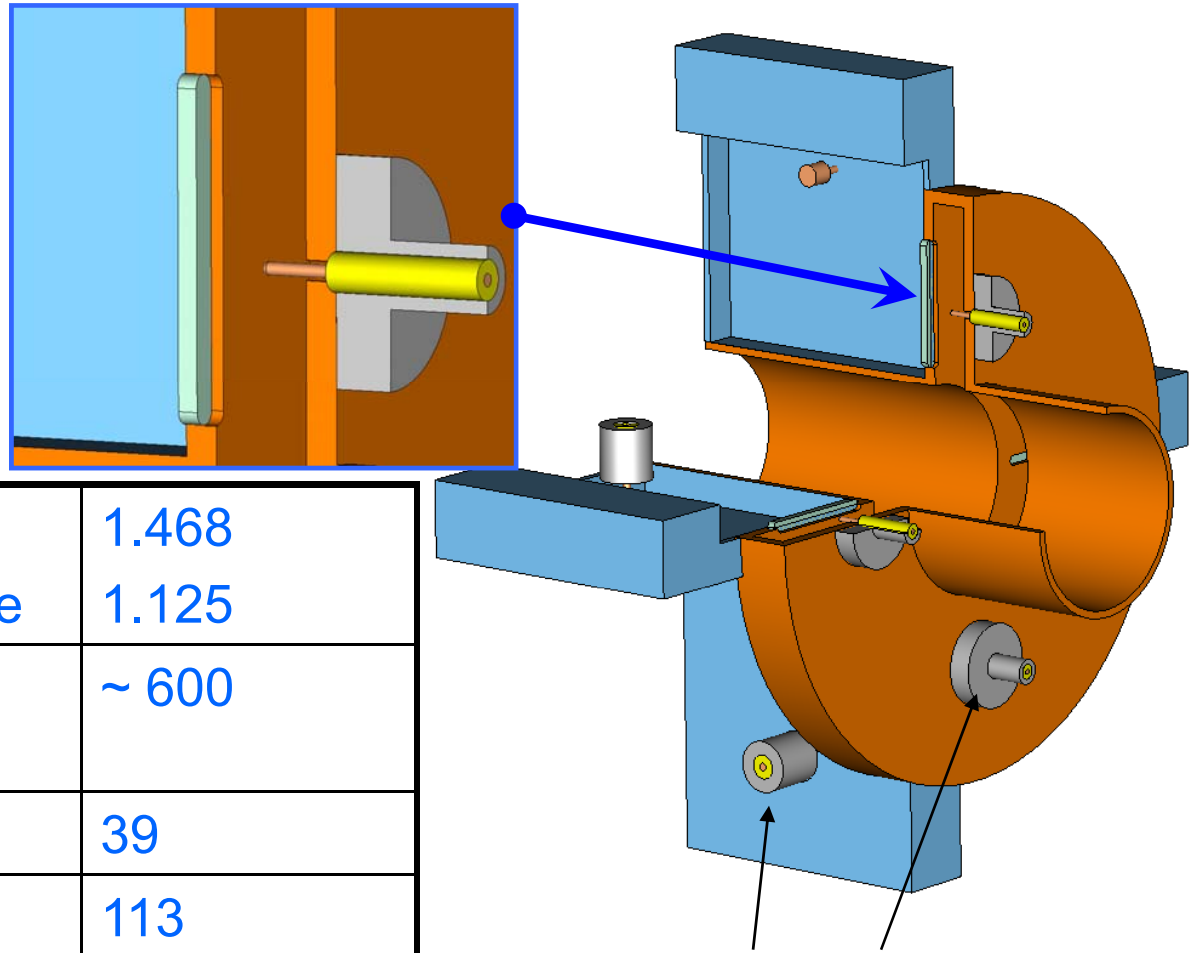

# SLAC Half Aperture S-Band BPM

- SLAC approach:
  - S-Band design with reduced aperture (35 mm)
  - Waveguide is open towards the beam pipe for better cleaning
  - Successful beam measurements at SLAC-ESA, ~0.5  $\mu\text{m}$  resolution
  - No cryogenic tests or installation
  - Reference signal from a dedicated cavity or source

# FNAL Full Aperture L-Band Design

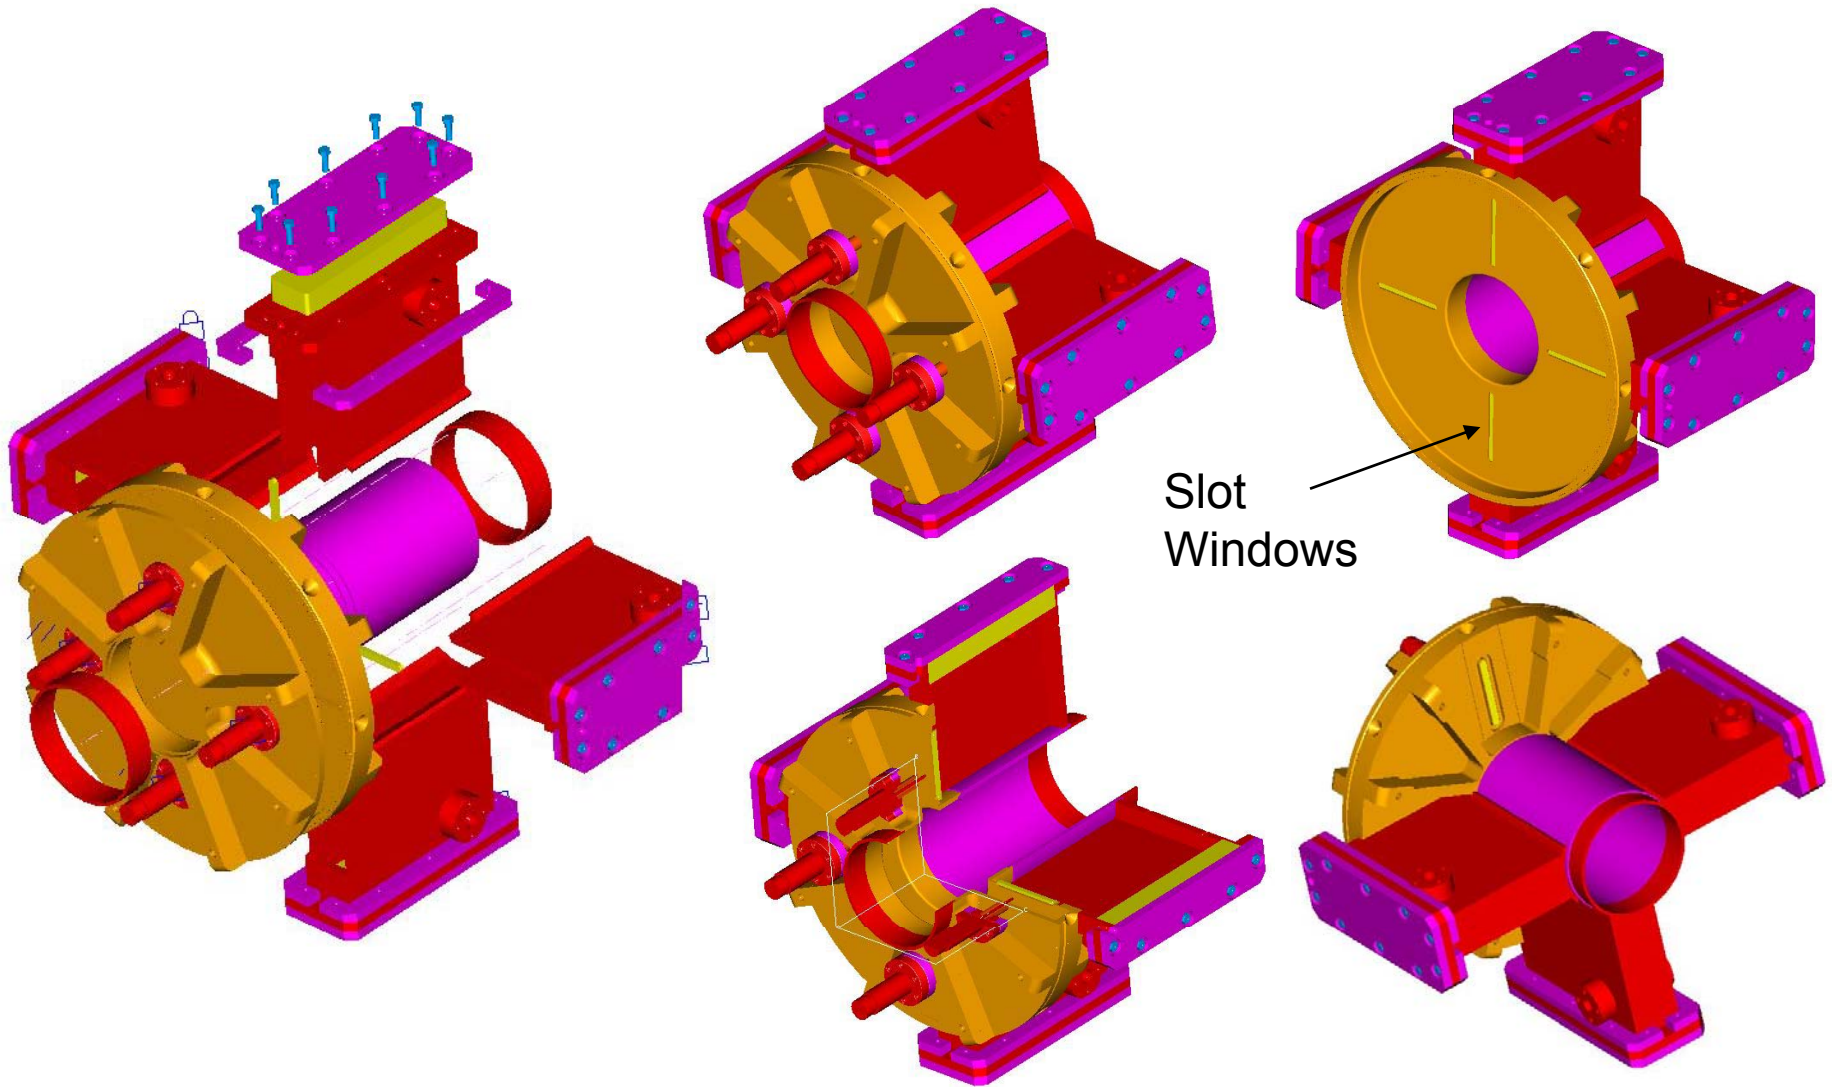

Window –  
Ceramic brick of  
alumina 96%  
 $\epsilon_r = 9.4$   
Size: 51x4x3 mm

N type receptacles,  
50 Ohm

Frequency, GHz, dipole	1.468
monopole	1.125
Loaded Q (both monopole and dipole)	~ 600
Beam pipe radius, mm	39
Cell radius, mm	113
Cell gap, mm	15
Waveguide, mm	122x110x25
Coupling slot, mm	51x4x3

# 1.5 GHz Cavity BPM at FNAL

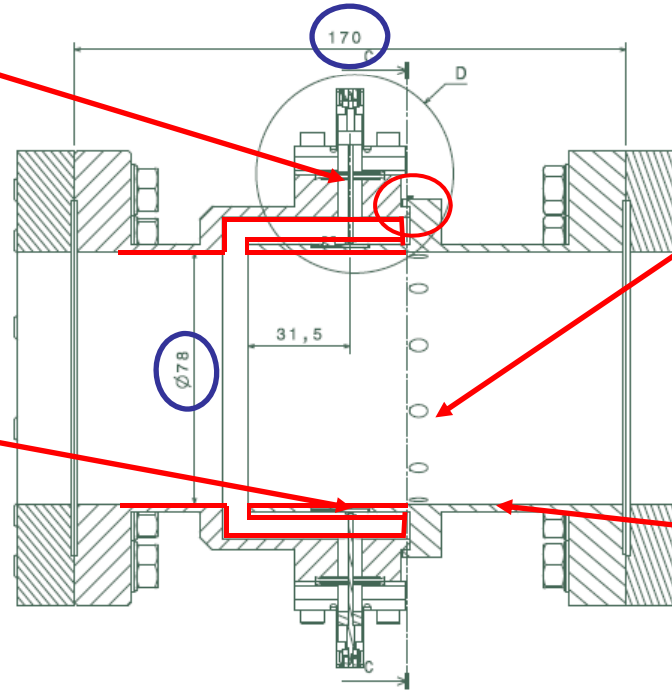

# Reentrant Cavity BPM for XFEL

Cryogenics tests at 4 K on feed-throughs is OK

Cu-Be RF contacts welded in the inner cylinder of the cavity to ensure electrical conduction.

Achieved ~ 5  $\mu\text{m}$  Resolution

Twelve holes of 5 mm diameter drilled at the end of the re-entrant part for a more effective cleaning (Tests performed at DESY).

Copper coating (depth: 12  $\mu\text{m}$ ) to reduce losses. Heat treatment at 400°C to test: OK

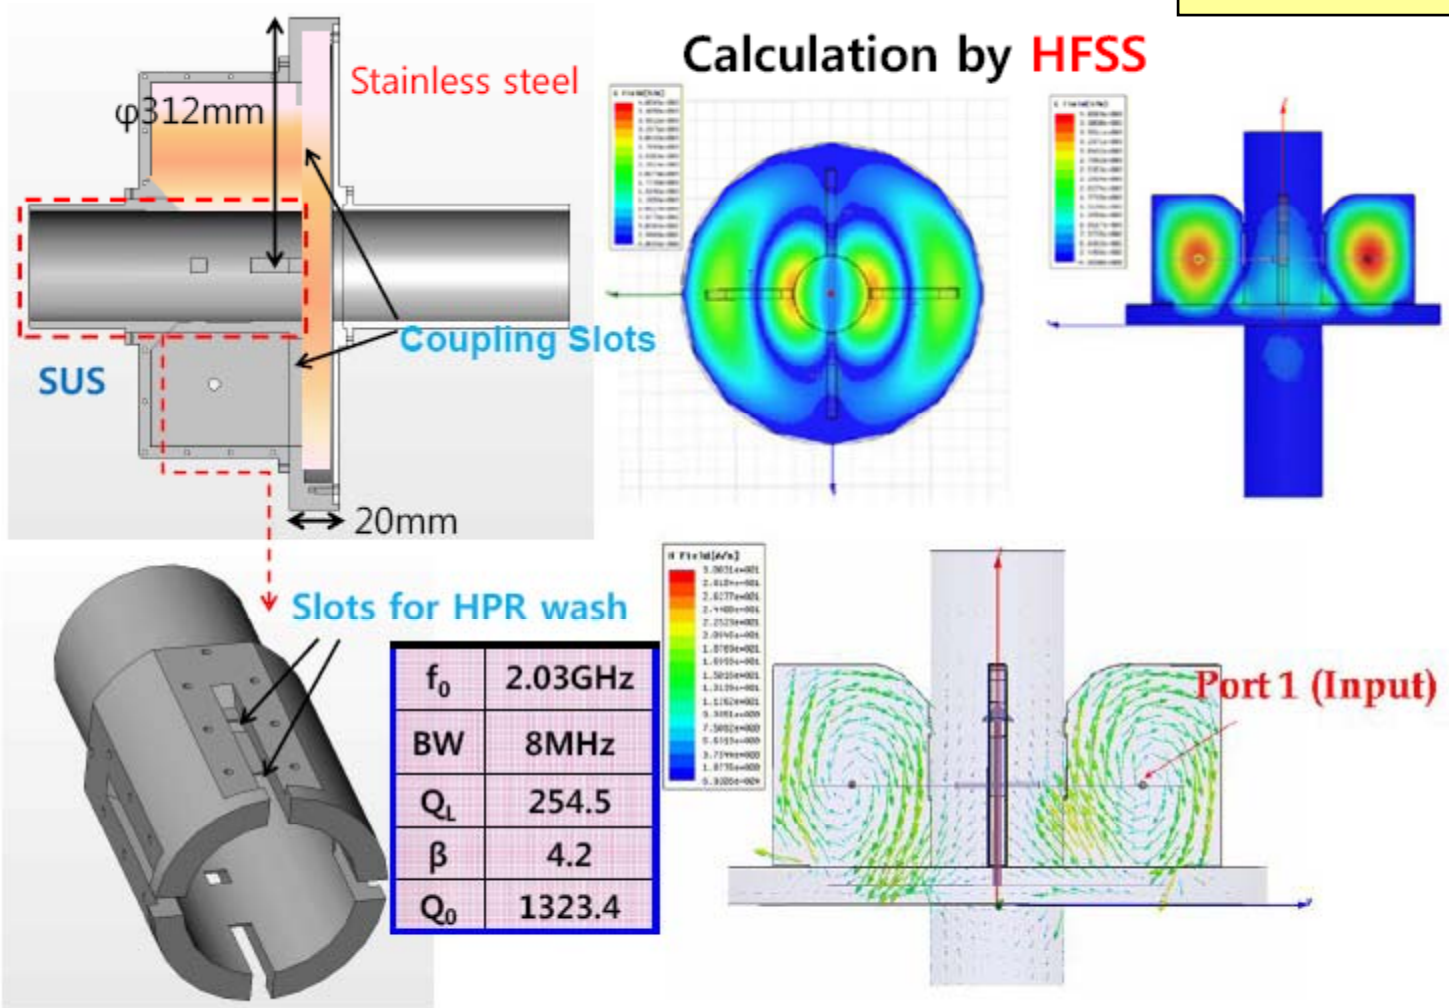

Eigen modes	F (MHz)	$Q_1$	$(R/Q)_1$ ( $\Omega$ ) at 5 mm	$(R/Q)_1$ ( $\Omega$ ) at 10 mm
	Measured	Measured	Calculated	Calculated
Monopole mode	1255	23.8	12.9	12.9
Dipole mode	1724	59	0.27	1.15

# TM12, Full Aperture, 2.0 GHz BPM

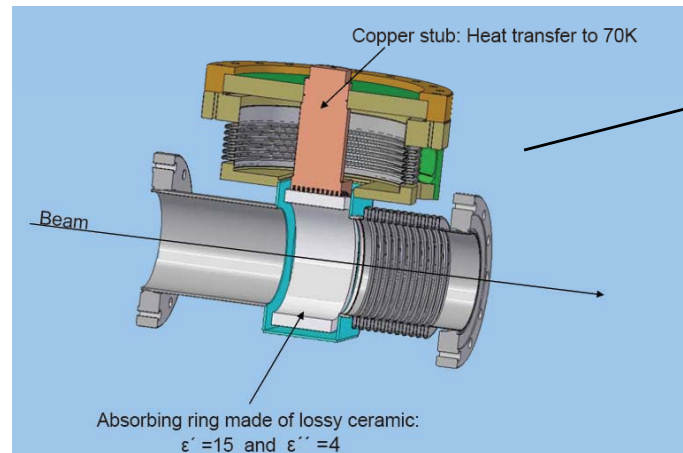

Sun Young Ryu, Jung Keun Ahn (Pusan National University)  
and Hitoshi Hayano (KEK-ATF)

**Achieved ~ 0.5  $\mu\text{m}$  Resolution**

# HOM Losses Along Beam Line at 70 K and 2 K

<b>One bunch Q=3.2nc, bunch length=10mm</b> Loss factor (V/pc)=9.96V/pc	<b>Lossy dielectric conductivity <math>\sigma_{\text{eff}}=0.6(\text{s/m})</math></b> <b>Dielectric constant <math>\epsilon_r=15</math>, within 80ns</b>
Total Energy Generated by Beam (J)	10.208e-5
Energy propagated into beam pipe (J)	4.44e-6
Energy dissipated in the absorber (J)	7.0e-7
Energy loss on the Non SC beampipe wall (J) around absorber	9.3e-10
Energy loss in intersection between two cavities (J)	1.3e-9 (cold copper conductivity=3500e6Simm/m)

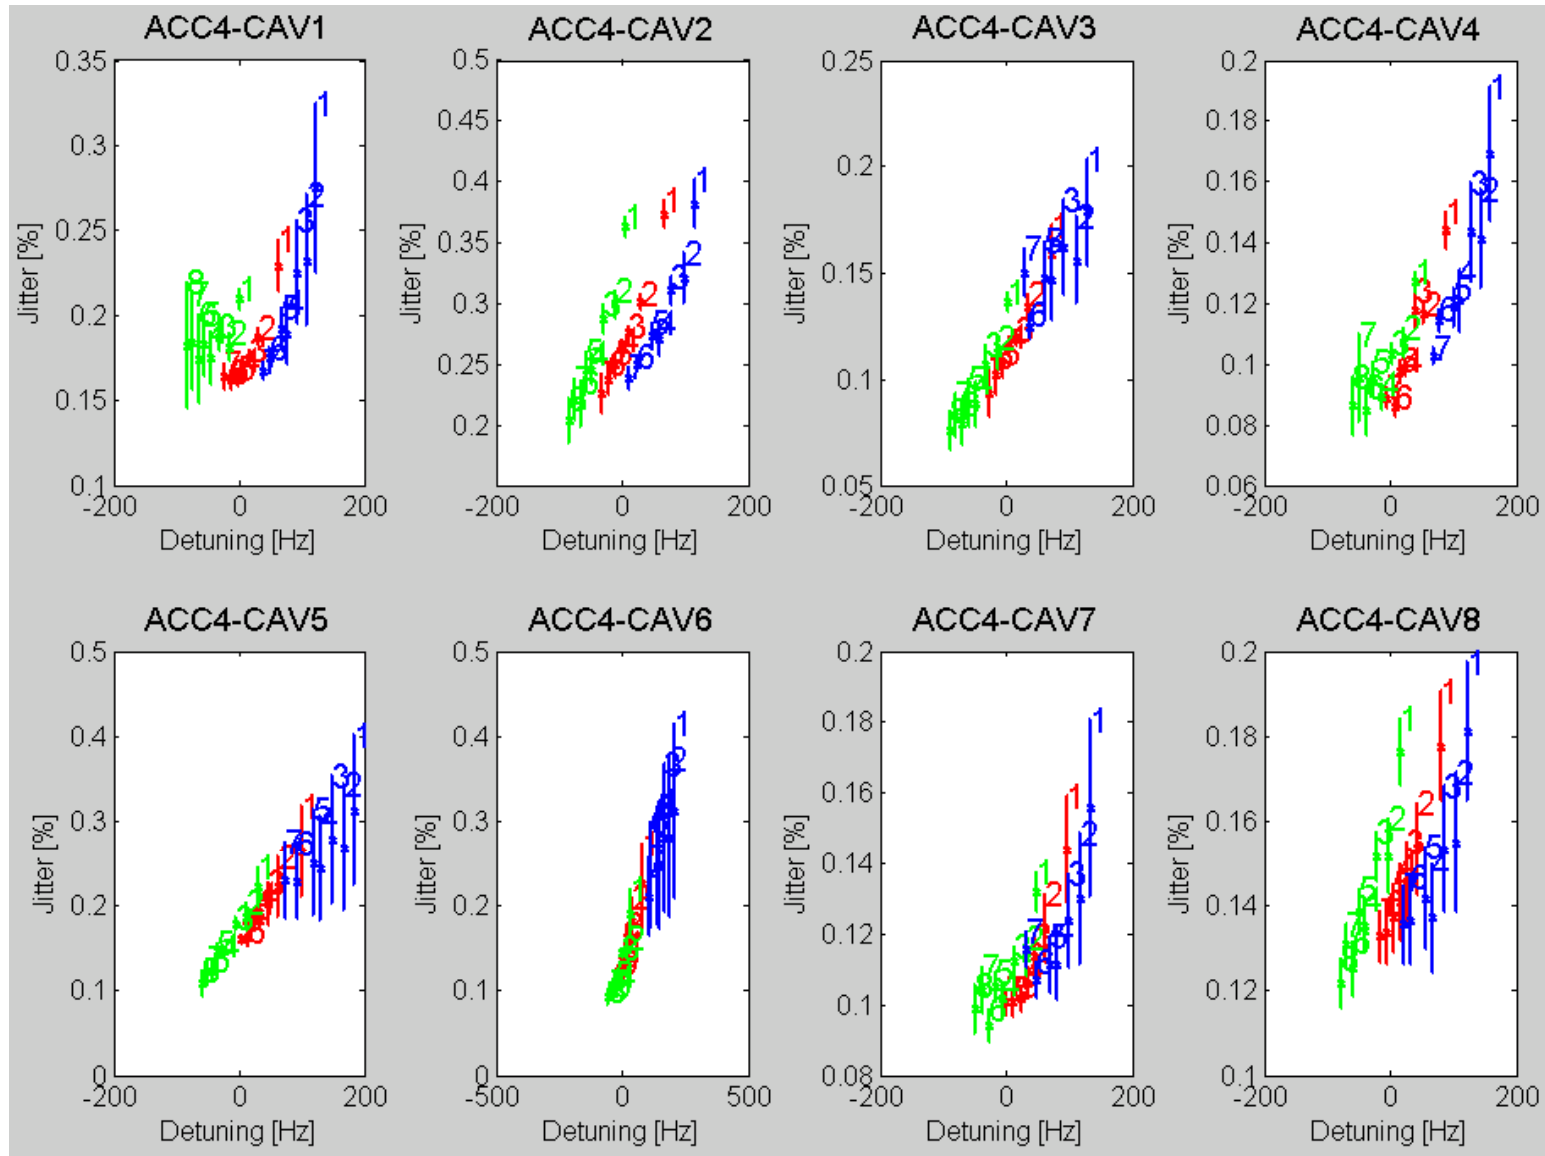

# RF Station Power Budget (Straw-man Proposal)

	Voltage loss	Power loss	Available Power (MW)
<b>High Level RF Loss Factors</b>			
Maximum Klystron Output Power		0.0%	10.00
De-rating of klystron for end of life time		0.0%	10.00
Modulator Ripple Spec = 1% (Often worse)	0%	0.0%	10.00
Waveguide and circulator losses		8.0%	9.20
Power loss due to cavity gradient variation		0.0%	9.20
Parameter variation	0.5%	1.0%	9.11
<b>Low Level RF Loss Factors</b>			
Peak power headroom	2.0%	4.0%	8.75
Dynamic Headroom	1.0%	2.0%	8.57
Beam current fluctuations of 1%pk		1.0%	8.49
Detuning errors of 30 Hz	1.0%	2.0%	8.32
Klystron drive noise sidebands	1.0%	2.0%	8.15
<b>Beam Power Requirments for 26 cavities</b>			
Power Required for 9.0ma @ 31.5 MV/m			7.651098
<b>Excess Power Headroom</b>			0.50 MW
			Power to Spare !
Note: Lower power per cavity -> higher QI and longer fill and decay times			
This requires a longer modulator pulse and higher cryo loading			
30 Hz detuning errors are the sum of microphonics and Lorentz force detuning. (Even if microphonics=0, we			

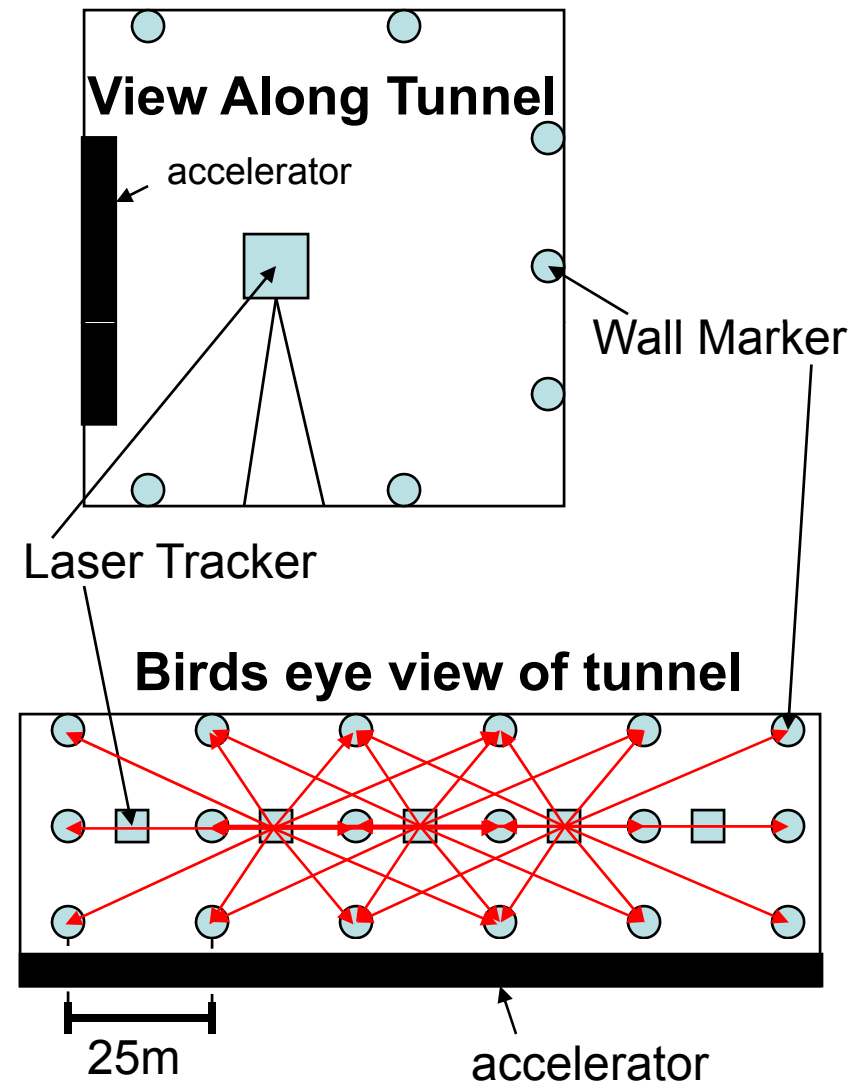

# Studying FLASH Cavity Gradient Stability

Blue: Nominal + 100Hz Initial Detuning; Red: Nominal Initial Detuning; Green: Nominal - 100Hz Initial Detuning.

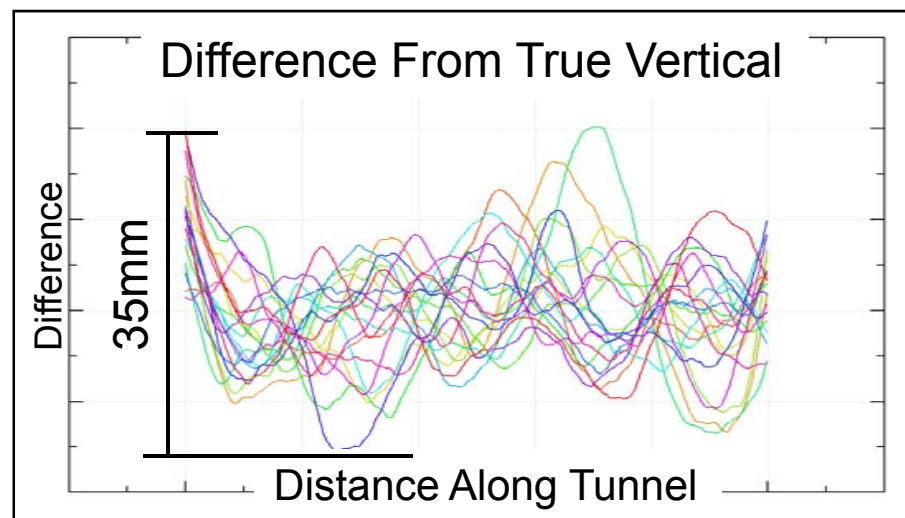

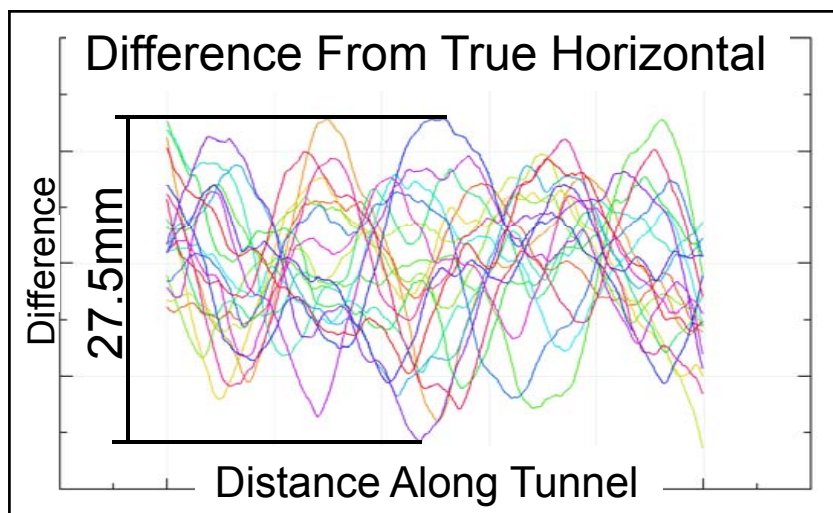

# Linac Alignment Network

- Rings of 7 markers placed every 25m
  - Would like every 10m but current adjustment software not capable
- Network is Measured by a Laser Tracker
  - Laser tracker is placed between marker rings
  - Measures 2 rings up and down the tunnel
  - Statistical measurement Errors
    - Distance :  $0.1\text{mm}+0.5\text{ppm}$
    - Azimuth :  $4.7\ \mu\text{rad}$
    - Zenith :  $4.7\ \mu\text{rad}$
    - Errors estimated by experienced surveyors and laser tracker operators from DESY
  - Ignored all systematic errors from refraction in tunnel air (top hotter than bottom)

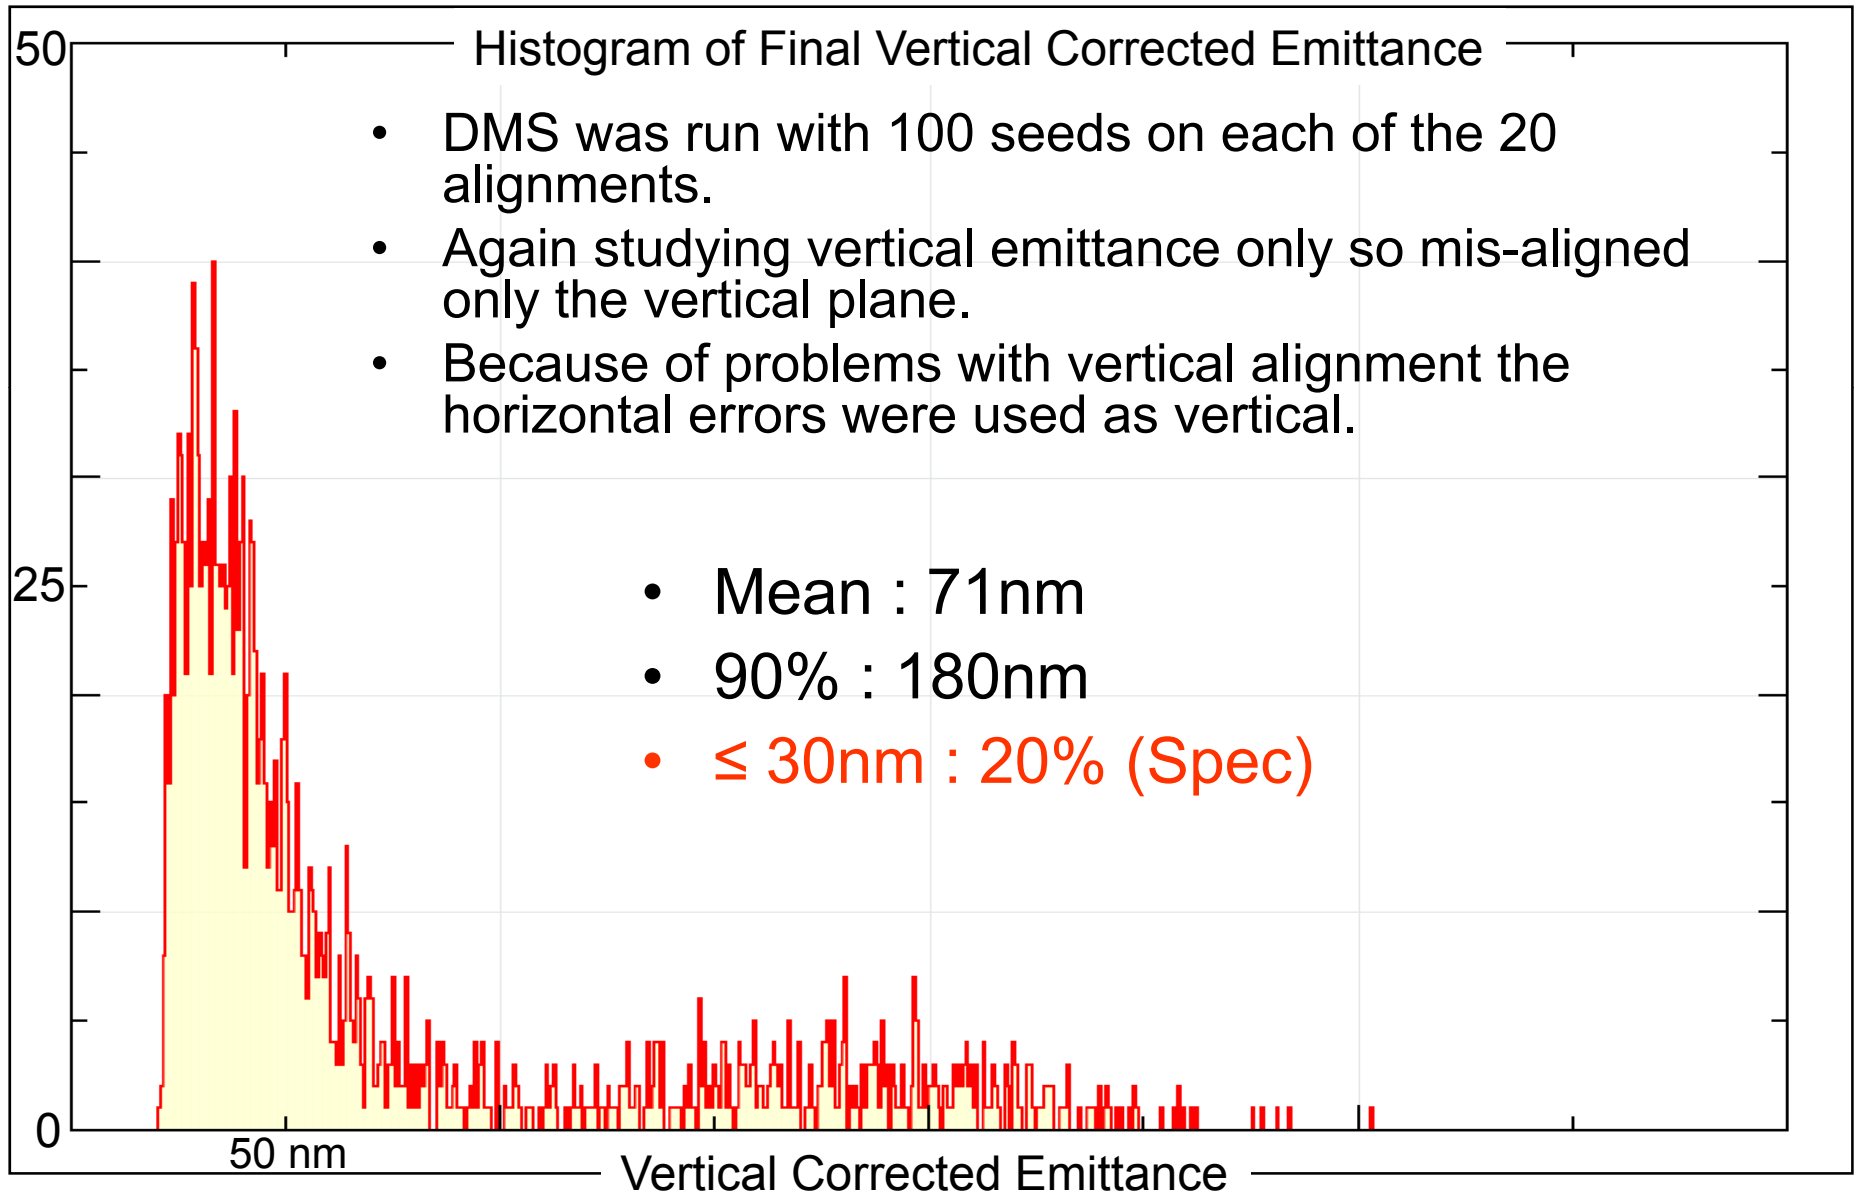

# Alignment Simulations

- Use PANDA to calculate error propagation through network
- 20 Reference Networks were simulated in JAVA
  - Length 12.5km
  - Including GPS every 2.5km assuming 10 mm rms errors
- Problem with vertical adjustment under investigation at DESY and by authors of PANDA

# Emittance Growth Simulations

# MLI Summary

- Quad Package
  - Have SC quad that meets ILC spec and BPMs that look promising
  - Discussing issues of type of quad ( $\cos(2\phi)$  vs superferric) and whether to use a split quad
- Studies
  - Effectiveness of the HOM Absorber
  - RF Overhead and model for cavity gradient variations within and between pulses
    - Relevant for Klystron Cluster scheme
  - Linac Alignment
    - Conventional techniques may not be adequate – better models needed
