NLO

Implications

Conclusions

For certain processes, NNLO is needed

- when the **NLO corrections are large**, e.g. Higgs production
- for **benchmark measurements** where experimental errors are small or to facilitate calibration of detectors and determine efficiencies
- to minimize **PDF and luminosity uncertainties**

From the updated Les Houches wishlist 2007:

process wanted at/beyond NNLO	
10. $gg \rightarrow W^* W^* \mathcal{O}(\alpha^2 \alpha_s^3)$	background to Higgs
11. $pp \rightarrow t\bar{t}$	benchmark process
12. VBF, $Z/\gamma + \text{jet}$	Higgs couplings, SM benchmark
13. W/Z production at NNLO QCD, NLO EW	SM benchmark

LHC and ILC Processes Known at NNLO

NNLO

NLO

- The LHC Wishlist
- NLO Calculations
- One-Loop Matrix Elements
- $pp \rightarrow t\bar{t}b\bar{b}$
- New Ideas
- Generalized Unitarity
- From Boxes to Complete Amplitudes

Implications

Conclusions

Ingredients:

- One-loop (virtual) matrix elements
- Tree-level matrix elements for real emission
- Both have IR divergences, which cancel in the full cross section \Rightarrow subtraction terms
- Convolution with PDFs (only for hadronic collisions)
- Integration over final state phase space (with cuts)

Bottleneck up until now: 1-loop matrix elements

One-Loop Matrix Elements

Introduction

NNLO

NLO

- The LHC Wishlist
- NLO Calculations
- One-Loop Matrix Elements
- $pp \rightarrow t\bar{t}b\bar{b}$
- New Ideas
- Generalized Unitarity
- From Boxes to Complete Amplitudes

Implications

Conclusions

Any (massless) one-loop integral can be decomposed into

$$\begin{aligned}\mathcal{M} &= \sum_i d_i^D I_{4i}^D + \sum_i c_i^D I_{3i}^D + \sum_i b_i^D I_{2i}^D \\ &= \sum_i d_i^{D=4} I_{4i}^D + \sum_i c_i^{D=4} I_{3i}^D + \sum_i b_i^{D=4} I_{2i}^D + R\end{aligned}$$

Integrals are known, task is to **determine the coefficients**

Integrals tabulated in: Bern, Dixon, Dunbar, Kosower; Ellis, Zanderighi

Implications

Conclusions

Any (massless) one-loop integral can be decomposed into

$$\begin{aligned}\mathcal{M} &= \sum_i d_i^D I_{4i}^D + \sum_i c_i^D I_{3i}^D + \sum_i b_i^D I_{2i}^D \\ &= \sum_i d_i^{D=4} I_{4i}^D + \sum_i c_i^{D=4} I_{3i}^D + \sum_i b_i^{D=4} I_{2i}^D + R\end{aligned}$$

Integrals are known, task is to **determine the coefficients**

Standard procedure:

- Generate all Feynman diagrams \Rightarrow many terms
- Translate into equations \Rightarrow many more terms
- Reduce to known Master integrals \Rightarrow large cancellations between spurious singularities

$$pp \rightarrow t\bar{t}b\bar{b}$$

Generalized unitarity and recursion reuse amplitudes, not Feynman diagrams ⇒ excellent scaling with number of external legs

Generalized Unitarity

Introduction

NNLO

NLO

- The LHC Wishlist
- NLO Calculations
- One-Loop Matrix Elements
- $pp \rightarrow t\bar{t}b\bar{b}$
- New Ideas
- Generalized Unitarity
- From Boxes to Complete Amplitudes

Implications

Conclusions

Determine coefficients without doing explicit reduction by generalized unitarity: put internal propagators on-shell

$$\frac{1}{p^2 + i\epsilon} \rightarrow i\delta^+(p^2)$$

Thus for boxes, the coefficient collapses into a **product of 4 tree amplitudes** (in $D = 4$)

$$\left(\int d^4l \delta^+(l_1^2) \delta^+(l_2^2) \delta^+(l_3^2) \delta^+(l_4^2) \right)$$

From Boxes to Complete Amplitudes

Conclusions

- Conclusions and Outlook
- Omissions
- Outlook

■ Progress at NNLO

fully differential distributions, several more new calculations soon to be completed

■ Tremendous progress at NLO

Feynman diagrams: first 2 \rightarrow 4 results

New methods reuse amplitudes instead of Feynman diagrams via generalized unitarity and recursion, OPP reduction

■ General purpose NLO amplitude codes being developed, progress toward agreement on common interface at Les Houches 2009

\Rightarrow event generators incl. parton showers at NLO?

■ Lesson learned from NLO calculation for LO simulation: **choose your scale wisely!**

■ New jet algorithms

Whichever one you use, please choose an **infrared safe** one!
