Introduction

- We have **already presented** the result of Lorentz Force Detuning at STF (Phase–1.0) in several conferences.
 - TU3RAI04(E. Kako), TU5PFP075(Kirk) @PAC09
 - TUPPO007(Kirk), TUPPO021(E. Kako) @SRF09
- Since last year, we do not do a cryomodule test with a high power klystron.
- Therefore, the same result will be presented here again using the above presentation.
- **I already reported the similar presentation at TILC09.**

Superconducting rf Test Facility (STF)

Valve Box
Tesla-like Cavities

**6-m Cryomodule
for STF Phase-1.0**

Started in April 2005'

→ Completed in Mar. 2008'

→ Cool-down in May 2008'

Four 9-cell cavities in the STF tunnel

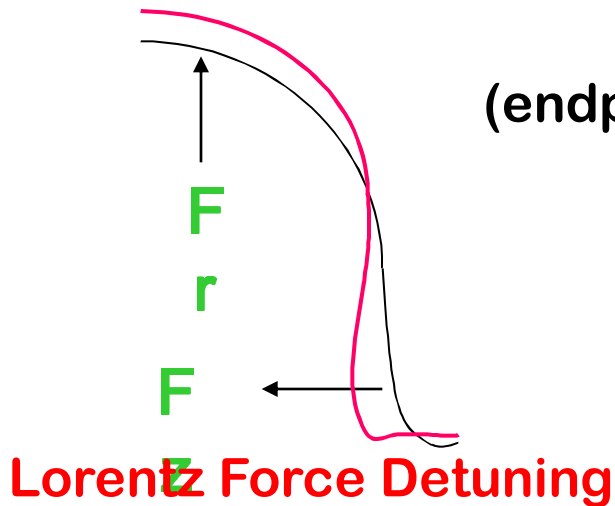

Cryomodule Cross-section

Purpose of STF Cryomodule Test

- To check the performance as a total **superconducting cavity system**, and to find out the improvement points for the future project.
- To confirm a stable pulsed operation at higher fields, and to compare **the achieved $E_{\text{acc,max}}$** in the cryomodule tests with the results in the vertical tests.
- To demonstrate a compensation of **Lorentz force detuning** by a piezo tuner, and to establish the effectiveness of an improved stiffness in a cavity support structure.

Stiffness of STF-BL Cavity-Tuner System

95 N / μm
(endplate, cylinder, flange)

290 N / μm
(slide-jack, **piezo**)

$$\frac{1}{K_S} = \frac{1}{K_{\text{Jacket}}} + \frac{1}{K_{\text{Tuner}}}$$

$K_S = 72 \text{ kN} / \text{mm}$

STF Baseline Cavity ; Improved Stiffness

	STF Baseline Cavity	TTF Cavity	
Stiffness of Cavity Sys.	72 kN/mm	22 kN/mm	Estimation at 31.5 MV/m
Lorentz Detuning at flat-top	$\Delta f = -150$ Hz	$\Delta f = -500$ Hz	

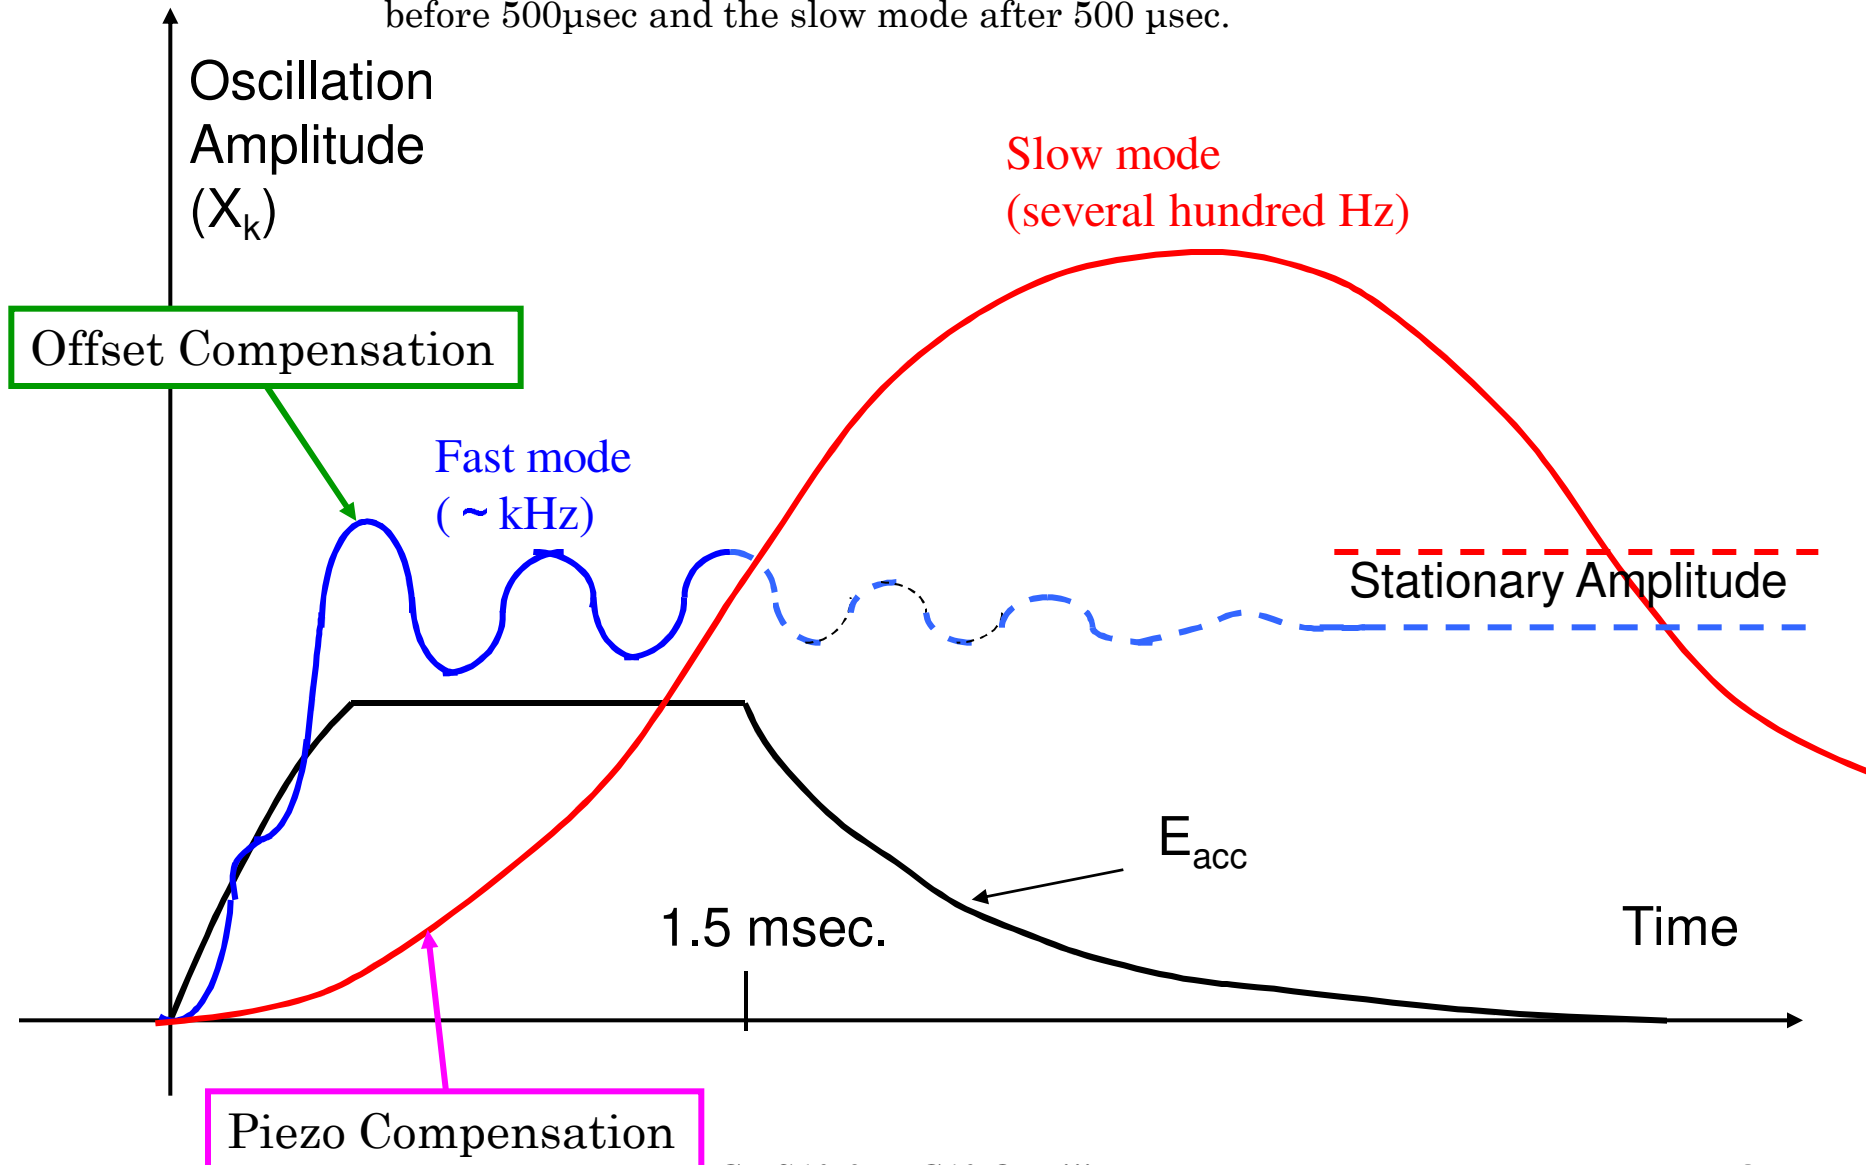

Mechanism of Slide-Jack Tuner

The Piezo performance was **good for the pulse operation** using a function generator, although it was **not good for the manually slow operation** due to some friction. We are investigating the cause by checking the movement at the room temperature.

Mechanical Oscillation (Two Modes Model)

Very roughly speaking, the fast mode is mainly contributed to the Lorentz Detuning before 500 μ sec and the slow mode after 500 μ sec.

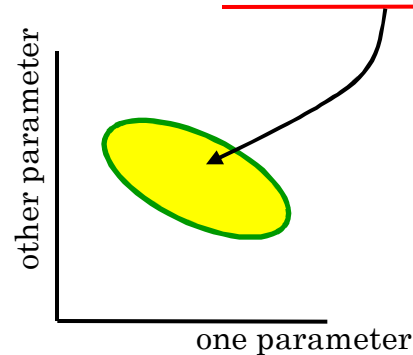

Adjustable parameters for compensation of Lorentz Detuning

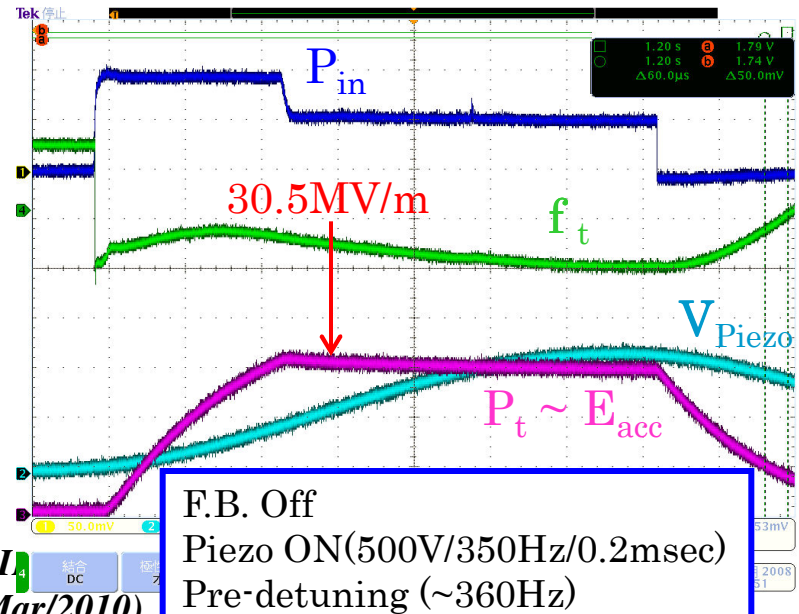

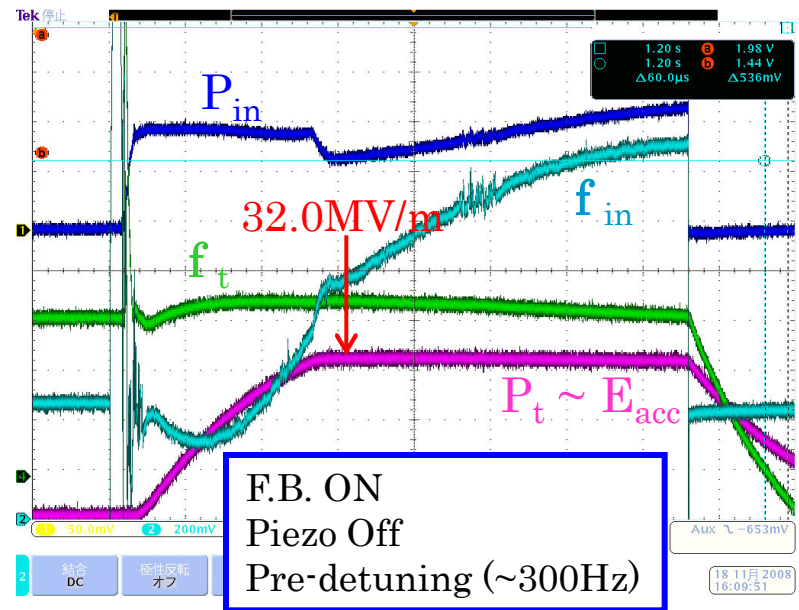

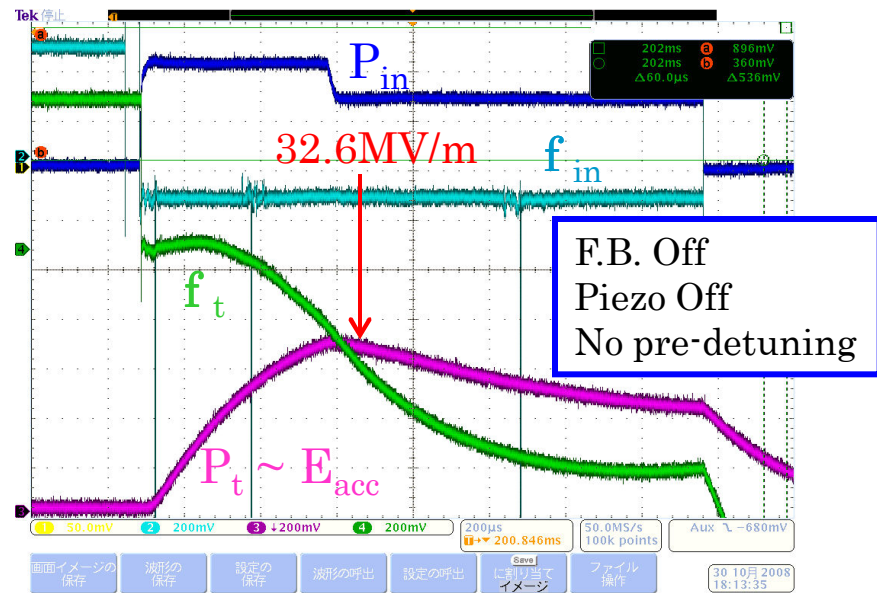

- f_{offset} : Initial offset of cavity frequency
- V_{Piezo} : Driving voltage of Piezo actuator
- f_{Piezo} : Driving frequency of Piezo actuator
- t_{delay} : Timing difference between RF pulse and Piezo action

If two parameters are fixed within these four parameters, we can obtain matrix data for optimum region of Piezo action.

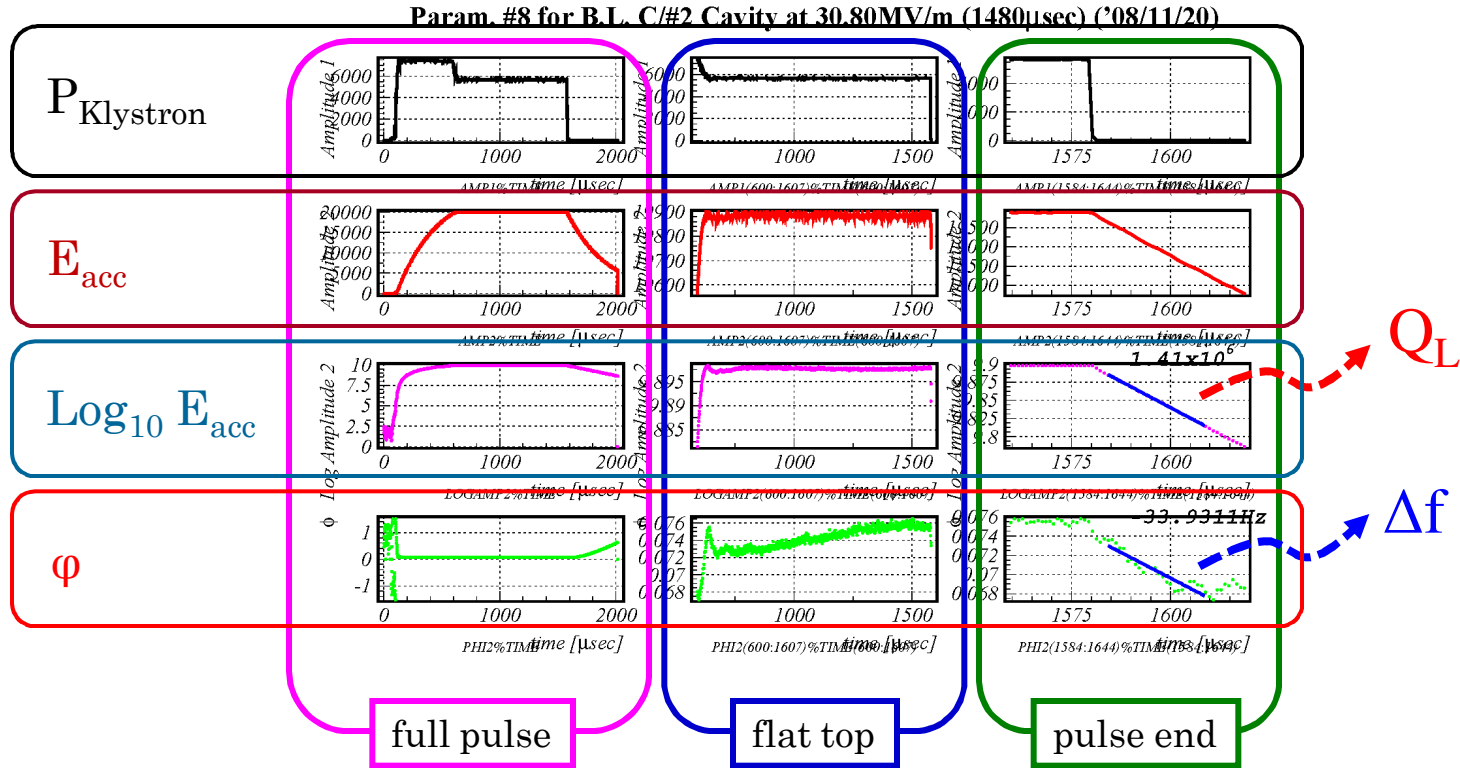

Observation of Lorentz Detuning

Example of measurement for Q_L & Δf

We usually use the **pulse-shortening method** for the measurement of Lorentz Detuning. It takes **about 10 minutes** to take data for one parameter of Piezo action. But it will be much faster for S-1 Global project!

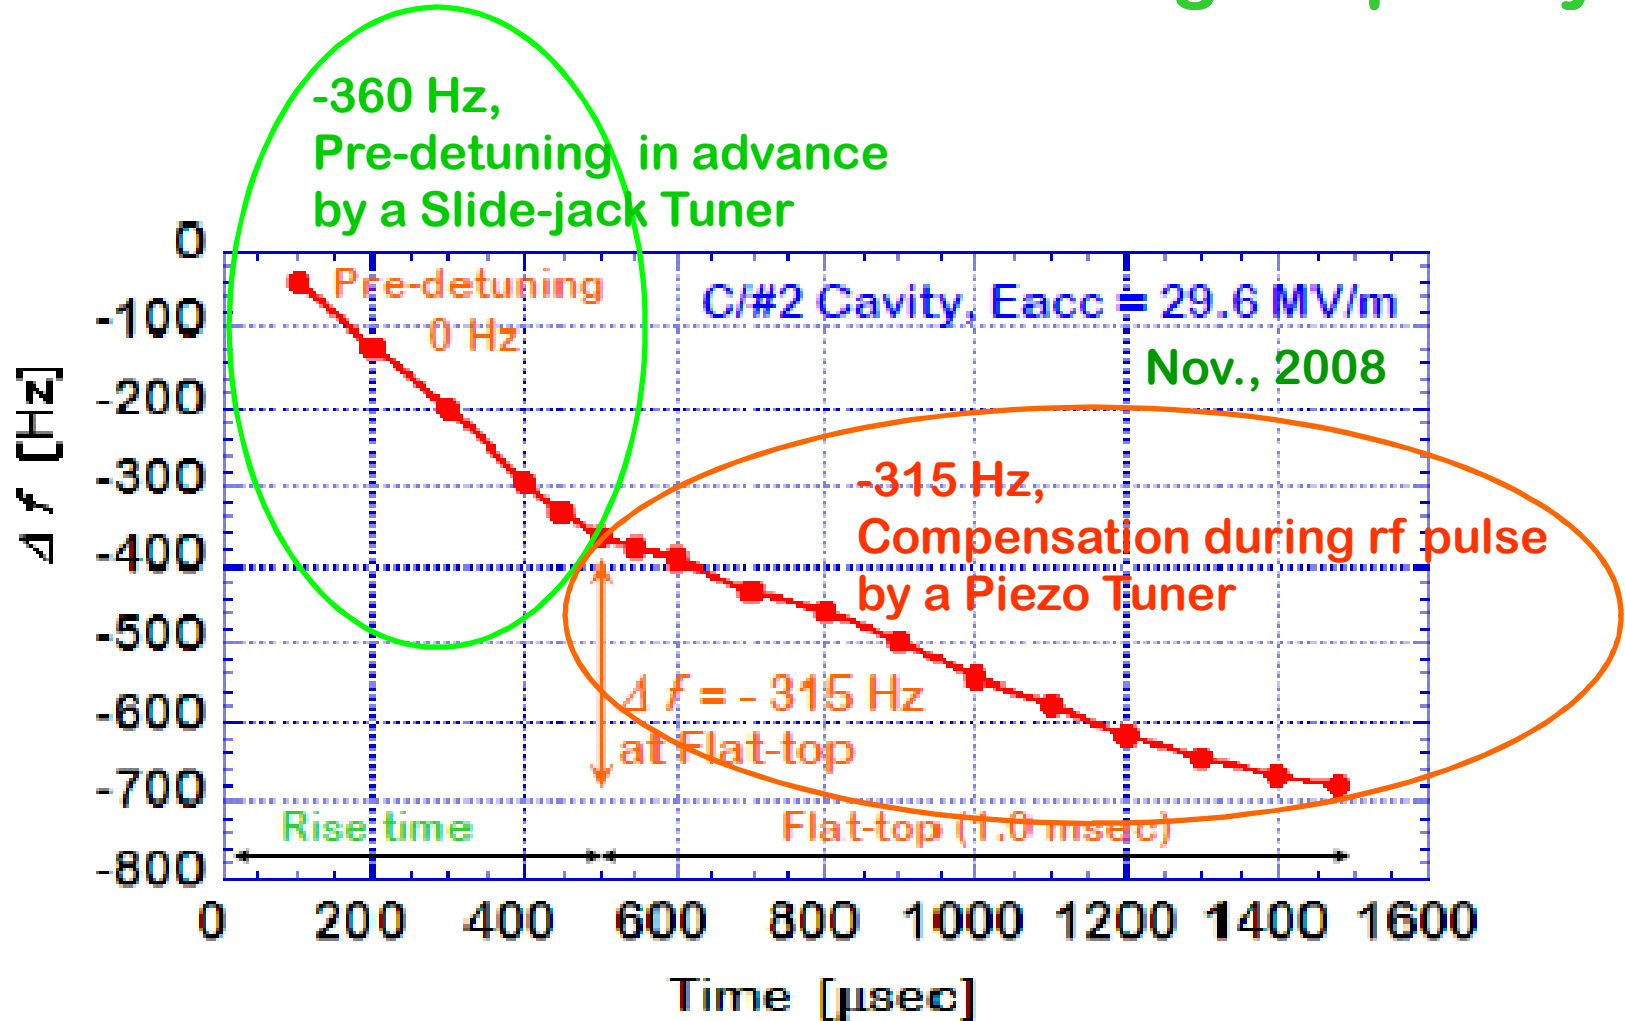

measurement timing:

100, 200, 300, 400, 450, 500, 550, 600, 700, 800, 900, 1000, 1100, 1200, 1300, 1400, 1480μsec

totally 17 points!

LCWS10 & ILC10 @Beijing

(27/Mar/2010)

Comparison between STF and other labs for Lorentz Force Detuning (comparison of required Piezo Stroke)

Required piezo stroke for compensation at 31.5 MV/m in Tesla-like cavity was reduced $\sim 50\%$ of that in the Tesla cavities.

Pulse stability test

2000 pulses data

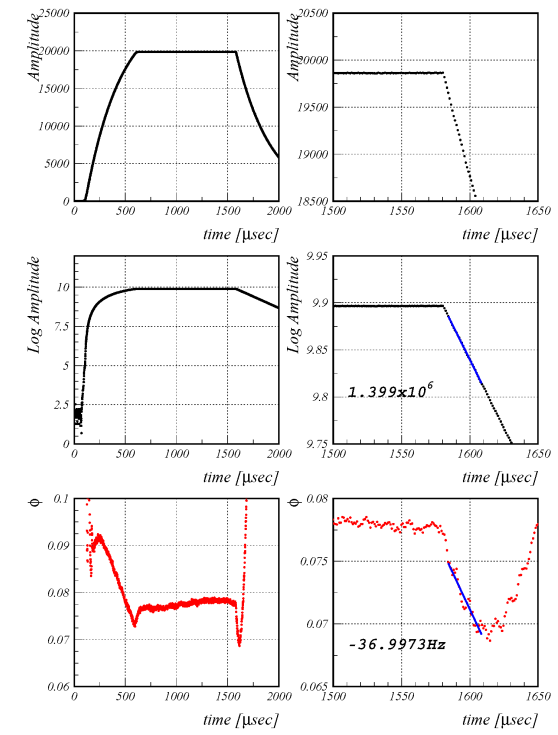

F.B. ON

2000 Pulses Stability of Lorentz Detuning for B.L. C/#2 Cavity (30.9MV/m)

During the high power test, one situation was kept for 16 minutes at the driving condition of Piezo.
 $(V_{\text{piezo}}/f_{\text{Piezo}}/t_{\text{piezo}} = 500\text{V}/350\text{Hz}/0.5\text{msec})$

example of one pulse

1 Lorentz Detuning for B.L. C/#2 Cavity ('08/11/20)

Q_L

Δf

peak field at flat-top (ADC counts)

peak-to-peak ratio at flat-top (field degradation)

We will try the stability test for a longer time in S1-Global project again!

Summary

- Piezo compensation at STF Phase-1.0 was **successful within $\pm 30\text{Hz}$** .
- Optimum condition of Piezo operation was relatively **wide**.
- High power operation with Piezo compensation was **stable at 30MV/m over 3 hours twice**.
- DAQ system of LLRF was **useful** for measurement of Lorentz Detuning.

Thank you for your attention!

*H. Hayano, E. Kako, S. Noguchi, M. Sato,
T. Shishido, K. Watanabe, Y. Yamamoto(KEK)*

We already presented these results in detail at PAC09 & SRF09!

Schilcher & Brandt's Method

Schilcher

The solution for $\mathbf{V}(t) = \begin{pmatrix} V_r \\ V_i \end{pmatrix}$ is defined on intervals with continuous function $f(t)$. In the case of $Q_L \gg 1$, $\omega_{1/2} \ll \omega_0$ and $\Delta\omega \ll \omega_0$, we obtain the approximation

$$\frac{d}{dt} \begin{pmatrix} V_r \\ V_i \end{pmatrix} = \begin{pmatrix} -\omega_{1/2} & -\Delta\omega \\ \Delta\omega & -\omega_{1/2} \end{pmatrix} \cdot \begin{pmatrix} V_r \\ V_i \end{pmatrix} + \begin{pmatrix} R_L\omega_{1/2} & 0 \\ 0 & R_L\omega_{1/2} \end{pmatrix} \cdot \begin{pmatrix} I_r \\ I_i \end{pmatrix}.$$

Brandt

$$\Delta\omega = \dot{\varphi} - \omega_{1/2} \frac{\rho}{r} \sin(\theta - \varphi). \quad (4.37)$$

Only the phase difference between input and output to cavity is effective!

Cavity Voltage Equation

From J. Slater

$$\frac{d^2}{dt^2} V(t) + \left(1 + j \frac{Q_L}{Q_o}\right) \frac{\omega_o}{Q_L} \frac{d}{dt} V(t) + \omega_o^2 V(t) = U(t)$$

$$\tilde{V} = \tilde{V}_d + (\tilde{V}_o - \tilde{V}_d) \exp\left(-\frac{t}{T_F}\right) \exp\left(j \frac{\tan \psi}{T_F} t\right)$$

Equi-angular Spiral

各項の係数が時間に関して一定であるなら解析的に解けるが、そうでない場合はどうする

Example of the calculation for the transient response

$$Q_L = 1.49 \times 10^6, f_{\text{init}} = 0 \text{ Hz}, \Delta f_{\text{Input}} = 0.5 \text{ Hz}/\mu\text{sec}, 180 \text{ Hz}/370 \text{ Hz}$$

Input data (frequency)

$$\tan \Psi = -2Q_L \Delta f / f_0$$

Input data (degree)

Output data (V_C)

Output data (ϕ_{Cavity})

仮定①

立ち上がりはfastとslowの2つのモードが混在する。flat-topではslowモードのみが寄与し、fastは無くなる。

仮定②

fast modeは時間に対して直線的に変化するものとする一方、slow modeはsine的な変化をするものとする。

Example of the calculation for the transient response①

No offset

$Q_L=1.49 \times 10^6$, $f_{init}=0\text{Hz}$, $\Delta f_{Input}=0.5\text{Hz}/\mu\text{sec}$, $180\text{Hz}/370\text{Hz}$

$Q_L=1.49 \times 10^6$, $f_{init}=0\text{Hz}$, $\Delta f_{Input}=0.5\text{Hz}/\mu\text{sec}$, $180\text{Hz}/370\text{Hz}$

Example of the calculation for the transient response②

+400Hz offset

$Q_L=1.49 \times 10^6$, $f_{init}=400\text{Hz}$, $\Delta f_{Input}=0.5\text{Hz}/\mu\text{sec}$, $180\text{Hz}/370\text{Hz}$

$Q_L=1.49 \times 10^6$, $f_{init}=400\text{Hz}$, $\Delta f_{Input}=0.5\text{Hz}/\mu\text{sec}$, $180\text{Hz}/370\text{Hz}$

ハイパワーテスト時の波形

No offset

+400Hz offset

周波数にオフセットが無い場合は、観測される空洞の位相は大きく変化し、かつフィールドも傾いてしまう。

しかし、少しオフセットを持たせると位相の変化は少なく、フィールドもほぼflatになる。この状態から残っているずれ量をピエゾで補正すればよい。

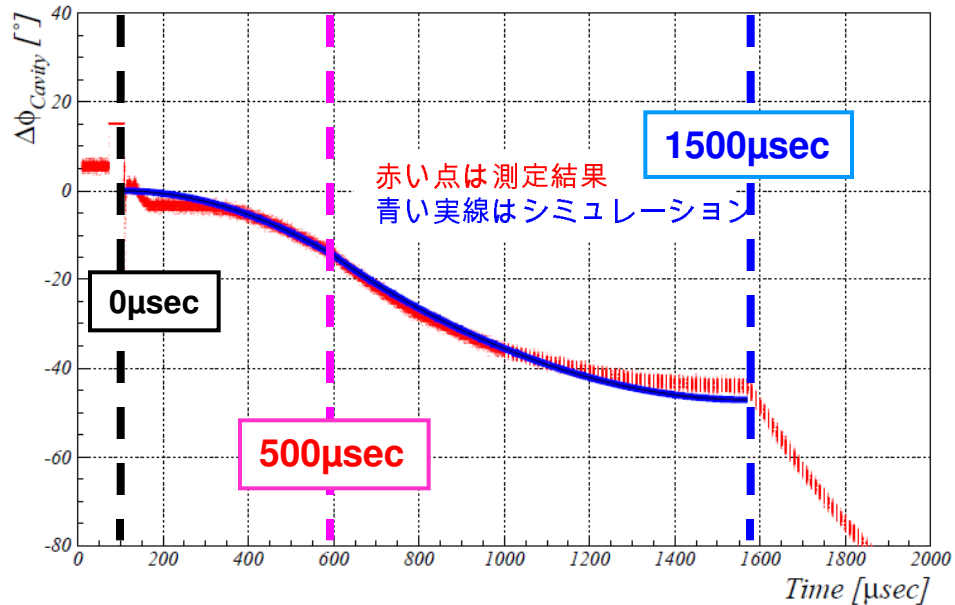

オフセットの量が適当でないとピエゾに過度の負担がかかり消耗が激しくなると予想さ

Comparison between experiment and calculation

No offset

+400Hz offset

$Q_L=1.49 \times 10^6$, $f_{\text{init}}=0\text{Hz}$, $\Delta f_{\text{Input}}=0.5\text{Hz}/\mu\text{sec}$, $180\text{Hz}/370\text{Hz}$

$Q_L=1.49 \times 10^6$, $f_{\text{init}}=400\text{Hz}$, $\Delta f_{\text{Input}}=0.5\text{Hz}/\mu\text{sec}$, $180\text{Hz}/370\text{Hz}$

計算結果は実験データを良く再現している。
“Two Modes Model”が妥当であることを意味している。

Piezo Compensationの測定例

resonanceからのずれを $\pm 50\text{Hz}$ (6.5°)程度に収めるには、空洞周波数に初期オフセットを設け、さらにPiezoを振って補正する必要がある。
