#### Status of Fast Detector Simulation

Mikael Berggren<sup>1</sup>

<sup>1</sup>DESY, Hamburg

Contribution to the LCFORUM Meeting, Hamburg, June 2010

Mikael Berggren (DESY-HH)

Status of Fast Detector Simulation

ILD meeting, Paris, 2011 1 / 28

#### Outline

#### The need for fast simulation • Ex1: $\gamma\gamma$ cross-sections

Ex2: SUSY scans

### Fast simulation

#### Performance

#### Status

Calorimeter simulation

### Conclusions

< — —

- We have very good full simulation now.
- So why bother about full simulation ?
- Answer:
  - Light-weight: run anywhere, no need to read tons of manuals and doxygen pages.
  - Anyhow, the LOI exercise showed that for physics, the fastSim studies were good enough.

But most of all:

Fast simulation is Fast !

So... Why do we need speed ?

- We have very good full simulation now.

< ロ > < 同 > < 回 > < 回 >

PYTHIA obtains a total cross-section for  $e^+e^- \rightarrow \gamma\gamma e^+e^- \rightarrow q\bar{q}e^+e^$ at  $E_{CMS} = 500$  GeV of 28371 pb (+ another 7170 pb if the diffractive and elastic components are included, but these classes do not contribute to high  $P_{T miss}$ -events)

- $\int \mathcal{L}dt = 500 \text{ fb}^{-1} \rightarrow 14 \star 10^9 \text{ events are expected.}$
- 10 ms to generate one event.
- 10 ms to fastsim (SGV) one event.

10<sup>8</sup> s of CPU time is needed, ie more than 3 years. This goes to 3000 years with full simulation.

Clearly, there is need to reduce this number by one or two orders of magnitude, by using generator level cuts.

PYTHIA obtains a total cross-section for  $e^+e^- \rightarrow \gamma\gamma e^+e^- \rightarrow q\bar{q}e^+e^$ at  $E_{CMS} = 500$  GeV of 28371 pb (+ another 7170 pb if the diffractive and elastic components are included, but these classes do not contribute to high  $P_{T miss}$ -events)

 $10^8$  s of CPU time is needed, ie more than 3 years. This goes to 3000 years with full simulation.

Clearly, there is need to reduce this number by one or two orders of magnitude, by using generator level cuts.

#### SUSY parameter scans

Simple example:

- MSUGRA: 4 parameters + sign of  $\mu$
- Scan each in eg. 20 steps
- Eg. 5000 events per point (modest requirement: in sps1a' almost 1 million SUSY events are expected for 500 fb<sup>-1</sup> !)
- =  $20^4 \times 2 \times 5000 = 1.6 \times 10^9$  events to generate...

Slower to generate and simulate than  $\gamma\gamma$  events

Also here: CPU millenniums with full simulation

#### Fast simulation

Different types, with different levels of sophistication:

- 4-vector smearing.
- Parametric. Eg SIMDET
- Covariance matrix machines. Eg. LiCToy, SGV

#### Common for all:

Detector simulation time  $\approx$  time to generate event by an efficient generator (PYTHIA 6, SUSYGEN)

I will talk about SGV.

#### SGV is a machine to calculate covariance matrices

Tracking: Follow track-helix through the detector, to find what layers are hit by the particle.

- From this, calculate cov. mat. at perigee, including effects of material, measurement errors and extrapolation. NB: this is exactly what Your track fit does!
- Smear perigee parameters accordingly, with Choleski decomposition (takes all correlations into account)
- Information on hit-pattern accessible to analysis. Co-ordinates of hits

accessible ( ) + = + + = +

#### Calorimeters:

- Follow particle to intersection with calorimeters. Decide how the detectors will act: MIP, EM-shower, hadronic shower, below threshold, etc.
- Simulate response from parameters.
- Merge close showers
- Easy to plug in other (more sophisticated) shower-simulation

#### Other stuff:

- EM-interactions in detector material simulated
- Plug-ins for particle identification, track-finding efficiencies,...
- Scintilators and Taggers

Calorimeters:

### SGV for the LC: TESLA/LDC/ILD

- Used for fastsim physics studies, eg. arXiv:hep-ph/0510088, arXiv:hep-ph/0508247, arXiv:hep-ph/0406010, arXiv:hep-ph/9911345 and arXiv:hep-ph/9911344.
- Used for flavour-tagging training.
- Used for overall detector optimisation, see Eg. Vienna ECFA WS (2007), See Ilcagenda > Conference and Workshops > 2005 > ECFA Vienna Tracking
- GLD/LDC merging and LOI, see eg. Ilcagenda > Detector Design & Physics Studies > Detector Design Concepts > ILD > ILD Workshop > ILD Meeting, Cambridge > Agenda >Sub-detector Optimisation I

The latter two: Use the Covariance machine to get analytical expressions for performance (ie. *not* simulation)

#### • Transformed to Fortran 95.

- Removed most CERNLIB dependence. Mostly by using Fortran 95's built-in matrix algebra.
- Managed in SVN.Install script included.
- Removed some options: PYTHIA pre version 6, SUSYGEN.
- Added several features:
  - Callable Whizard.
  - Input from stdhep.
  - Output of generated event to PYJETS or stdhep.
  - Sample subdirectory with steering and code for eg. scan single particles, create hbook ntuple with "all" information (can be converted to ROOT w/ h2root). And: output LCIO DST.
  - Development on calorimeters (see later)
- Tested to work on both 32 and 64 bit out-of-the-box.
- Timing verified to be faster (by 15%) than the f77 version.
- Will be made available for svn check-out/export shortly.

- Removed most CERNLIB dependence. Mostly by using Fortran 95's built-in matrix algebra.
- Managed in SVN.Install script included.
- Removed some options: PYTHIA pre version 6, SUSYGEN.
- Added several features:
  - Callable Whizard.
  - Input from stdhep.
  - Output of generated event to PYJETS or stdhep.
  - Sample subdirectory with steering and code for eg. scan single particles, create hbook ntuple with "all" information (can be converted to ROOT w/ h2root). And: output LCIO DST.
  - Development on calorimeters (see later)
- Tested to work on both 32 and 64 bit out-of-the-box.
- Timing verified to be faster (by 15%) than the f77 version.
- Will be made available for svn check-out/export shortly.

Mikael Berggren (DESY-HH)

- Transformed to Fortran 95.
- Removed most CERNLIB dependence. Mostly by using Fortran 95's built-in matrix algebra.
- Managed in SVN.Install script included.

#### Future developments

- Update documentation and in-line comments, to reflect new structure.
- Consolidate use of Fortran 95/203/2008 features:
  - Use of user-defined types.
  - Use of PURE and ELEMENTAL routines,
  - Optimal choice between pointer, allocatable and automatic and/or assumed-size, assumed-shape, and explicit arrays.
- I/O over FIFO:s to avoid storage and I/O rate limitations.
- The Grid.
- Investigate running on GPU:s.
- Possibly when gcc/gfortran 4.4 (ie. Fortran 2003) is common-place - Object Orientation, if there is no performance penalty.

#### The issues:

• Clearly: Random E, shower position, shower shape.

#### But also association errors:

- Clusters might merge.
- Clusters might split.
- Clusters might get wrongly associated to tracks.

#### • Consequences:

- If a (part of) a neutral cluster associated to track  $\rightarrow$  Energy is lost.
- If a (part of) a charged cluster not associated to any track Energy is double-counted.
- Other errors (split neutral cluster, charged cluster assolated with wrong track ....) are of less importance.
- These features are expected to depend on
  - The 4-mom of the incomming particle
  - The calorimeter entry point of the particle.
  - The shape of the cluster
  - The nature of the incomming particle

・ロト ・ 四ト ・ ヨト ・ ヨト

The issues:

  - Clusters might get wrongly associated to tracks.
- Consequences:
  - If a (part of) a neutral cluster associated to track  $\rightarrow$  Energy is lost.
  - If a (part of) a charged cluster not associated to any track → Energy is double-counted.
  - Other errors (split neutral cluster, charged cluster assolated with wrong track ....) are of less importance.
- These features are expected to depend on
  - The 4-mom of the incomming particle.
  - The calorimeter entry point of the particle.
  - The shape of the cluster
  - The nature of the incomming particle

20/28

The issues:

- Clearly: Random E, shower position, shower shape.
- But also association errors:
  - Clusters might merge.
  - Clusters might split.
  - Clusters might get wrongly associated to tracks.
- Consequences:
  - If a (part of) a neutral cluster associated to track  $\rightarrow$  Energy is lost.
  - If a (part of) a charged cluster not associated to any track → Energy is double-counted.
  - Other errors (split neutral cluster, charged cluster assolated with wrong track ....) are of less importance.
- These features are expected to depend on
  - The 4-mom of the incomming particle.
  - The calorimeter entry point of the particle.
  - The shape of the cluster
  - The nature of the incomming particle

Implementation of these mechanisms in SGV:

#### SGV already

- knows about where the particle hits the calorimeters.
- has procdures to generate energy, position and shower-axes from geometry file input parameters.
- has procedures to merge clusters based on generated shower positions and axes steerable by steering file.
- has procedures to associate clusters to tracks, also steerable.
- So what is needed is mostly to determine sensible parameters:
  - Cluster energy, position and axis distributions, given 4-mom of entering particle.
  - Probability to merge two clusters given their properties
  - Probability to associate incomming tracks to (possibly merged) clusters, given incomming 4-mom and cluster properties
  - Probability to split clusters.

Implementation of these mechanisms in SGV:

#### SGV already

- knows about where the particle hits the calorimeters.
- has procdures to generate energy, position and shower-axes from geometry file input parameters.
- has procedures to merge clusters based on generated shower positions and axes steerable by steering file.
- has procedures to associate clusters to tracks, also steerable.
- So what is needed is mostly to determine sensible parameters:
  - Cluster energy, position and axis distributions, given 4-mom of entering particle.
  - Probability to merge two clusters given their properties
  - Probability to associate incomming tracks to (possibly merged) clusters, given incomming 4-mom and cluster properties
  - Probability to split clusters.

#### Input: From full simulation and/or test-beam:

- E error for isolated (hadronic and em). Done.
- Cluster merge probability wrt. distance between true originators entering. On-going.
  - Not ideal: better to compare clusters with clusters, but difficult to know true cluster on DST.
- Track-Cluster merge probability wrt. distance between true originators and cluster props. On-going, but Pandora close to perfect, so maybe not needed.
- Split probability wrt. cluster props

Some development to SGV from this:

- NB: zdcalo is a user-routine (with a sensible default supplied), so code-wise one can do "anything" at the level of the single incomming particle.
  - Eg.: Splitting of clusters
- In SGV core:
  - Different properties neutral-charged originator.
  - More intricate track-cluster matching (or always correct?)
  - Handling splitting: one particle in to zdcalo, several out.

Use LOI sample (6k udsc), compare PandoraPFO:s to MCParticles

#### (Black solid: Charged, Red dashed: Neutral)

Mikael Berggren (DESY-HH)

Status of Fast Detector Simulation

< 🗇 🕨

Use LOI sample (6k udsc), compare PandoraPFO:s to MCParticles

- Probability to split cluster in two vs E
- Fraction the energy in the smaller cluster
- Distribution of fraction vs E
- Distance beteen split hadron-showers
- ... and EM

Compare Mokka+Marlin (Red) to LCIO-DST produced by SGV, with either perfect matching (but smeared meassurements) (Black), or with tentative cluster merging and EM-interations on (Blue). NB: no splitting, yet !

- Charged cluster energy.
- Neutral cluster energy
- Unseen neutral energy, due to associating track to neutral
- Double-counted charged enegry due to un-associated cluster.

#### Resulting Total visible energy

Degradation seen in Full simulation reproduced. Not enough double counting, but cluster splitting not yet included.

Mikael Berggren (DESY-HH)

#### Conclusions

- The need for FastSim was reviewed:
- Large cross-sections (γγ), or large parameter-spaces (SUSY) makes such programs obligatory.
- The SGV program was presented, and (I hope) was shown to be up to the job, both in physics and computing performance.
- The new developents were presented: Code over-haul: F77->F95, calorimeter parametrisation, extended generator-set, and full LCIO-DST as an output-format option.
- The near future plans for SGV were presented: Further improvment in confusion simulation by allowing for splitting, and by more precise parameters. Roll-out of the SGV 3.0 SVN. Longer term plans was also mentioned.
- First comparisions to Mokka/Marlin with a first tentative tuning was shown to be promising.
