Radiology/Barnes Hospital, St. Louis*

# Breast Cancer

40-year-old female with breast cancer had lumpectomy along with chemo/radiation therapy one year prior. The patient experienced pain in the right shoulder 10 months later.

Bone scan negative. CT scan initially read as negative.

Whole-body, FDG PET scan found numerous lymph node metastases in the upper chest.

Treatment plan based on conventional diagnostic techniques would have been watchful waiting. PET scan found a number of lymph node metastases, and patient was put back on chemo/radiation therapy. Re-read of CT after PET still could not accurately gauge extent of disease.

## Mysteries of the brain being revealed

By Ronald Kotulak  
Science Writer

The brain is the body's last and greatest mystery, but it is beginning to yield its fabulous secrets.

Scientists are discovering the biological bases for mental disorders and are working on ways to actually see thoughts, raise IQs, improve memory and alter the 3-pound organ in ways not yet dreamed of.

Already new findings about the causes of mental illness have had a dramatic impact on the mentally ill, not only leading to new treatments but also easing the stigma by shifting the blame from the victim to brain chemistry—and thus encouraging more people to seek help.

But even bigger payoffs are looming as scientists develop ways to attack some of the brain's most common disorders—injury, mental retardation, learning and memory problems, stroke, Alzheimer's disease, Parkinson's disease, schizophrenia and aggression.

The new era in brain research is being accelerated by advances in molecular biology that allow scientists to take the brain apart piece by piece and put it together to learn how it works. Their new tools are helping them see things that were once invisible.

Peer inside the brain with the new PET scanning device, it is possible to

### New view of the living human brain

**Imaging technique:** A side view of the brain of a 10-year-old girl suffering from focal encephalitis shows in a single image both the detailed structure and function of the brain. The computer technique, pioneered at the University of Chicago, combines in one image two separate tests. One test uses magnetic fields to make images of internal structures. A second test measures the brain's metabolic activity.

**Test results:** The combined image shows an infection at the top of the patient's brain that is paralyzing a foot. The yellow patch with a green core in an area that should be all red indicates infection.

● Probe the mind's secret for controlling the body. Tantalizing evidence that the brain and body are more profoundly interconnected than expected may outline the link between stress and disease and, conversely, uncover ways that the mind can be used to heal the body.

● Explore the mystery of learning and memory. Using powerful new technology, researchers can trace brain chemicals and neural pathways responsible for thoughts.

● Develop new treatments for such mental disorders as depression—which, because of recent advances in drugs and therapy techniques, can now be treated successfully in 9 out of 10 patients. One in 5 Americans suffers from a diagnosable mental disorder.

The neuroscience gold rush is largely due to the growing conviction that asking the brain to understand itself is no longer an unsolvable conundrum. Still, it is the challenge ever un-
