

(s)T3B Update – Calibration and Temperature Corrections

AHCAL meeting– December 13th 2011 – Hamburg

Max-Planck-Institut für Physik
(Werner-Heisenberg-Institut)

Christian Soldner
Max-Planck-Institute for Physics

Outline

- Introduction: CALICE and T3B
- Calibration to the MIP scale: Sr90 Data
- Verify Calibration Principle: TB Muon Data
- Roadmap

THE CALICE CALORIMETER AND **THE T3B EXPERIMENT**

The T3B Experiment

What is T3B?

- One row of 15 scintillator tiles
- Tile dimensions: $3 \times 3 \times 0.5 \text{ cm}^3$
- Light Readout by SiPMs: MPPC-50P
- Data Acquisition: 4 fast USB Oscilloscopes

Setup optimized to observe the time development of hadron showers

CALICE:

- + 3D reconstruction of hadronic shower shapes
- No timing information on the showers \rightarrow (s)T3B

Temperature Sensors

1 Temperature Sensor PT1000 for each T3B cell

The T3B Experiment within the CALICE AHCAL

Tungsten AHCAL

Steel SDHCAL

Run Periods: PS: Nov 2010
SPS: June/July/Sept 2011

Energy Range: 2-300GeV

Trigger: CALICE Synchronous

Shower Depth: $\sim 3\lambda_1$ (PS), $\sim 5\lambda_1$ (SPS)

Total Had. Events: 27 Million

Run Periods: SPS: October 2011

Energy Range: 40-180GeV

Trigger: T3B Standalone

Shower Depth: $\sim 6\lambda_1$

Total Had. Events: 5 Million

The T3B Experiment within the CALICE Calorimeters

Tungsten AHCAL

Energy [GeV]	Calice-Sync + [MEv]	Calice-Sync - [MEv]
6	1,2	1,7
8	1,5	1,5
10		4,6
40	2,0	
50		1,7
60	4,1	
80	4,5	
150		1,2
180	0.9	0.7

Steel SDHCAL

Energy [GeV]	T3B Standalone + [MEv]
60	1,6
80	2,0
180	1,2

CALIBRATION TO THE MIP SCALE: SR90 DATA

T3B Calibration to the MIP Scale: Sr90 Data

During the Test Beam T3B monitors the SiPM Gain continuously

→ This data can be used to calibrate energy depositions to the MIP Scale

Assumption: The MIP MPV depends in first order only(!) on the Gain

T3B Calibration to the MIP Scale: Sr90 Data

During the Test Beam T3B monitors the SiPM Gain continuously
→ This data can be used to calibrate energy depositions to the MIP Scale
Assumption: The MIP MPV depends in first order only(!) on the Gain

Offline Calibration Setup:

- Sr90 Source with end point energy of 2.27MeV
- Coincidence trigger to ensure penetration of tile under study
- Consecutive calibration of all T3B cells individually
- Use T3B DAQ: Acquire Sr90 and SiPM gain data at the same time
- Use climate chamber to ensure temperature stability

T3B Calibration to the MIP Scale: Sr90 Data

During the Test Beam T3B monitors the SiPM Gain continuously
→ This data can be used to calibrate energy depositions to the MIP Scale
Assumption: The MIP MPV depends in first order only(!) on the Gain

Offline Calibration Setup:

- Sr90 Source with end point energy of 2.27MeV
- Coincidence trigger to ensure penetration of tile under study
- Consecutive calibration of all T3B cells individually
- Use T3B DAQ: Acquire Sr90 and SiPM gain data at the same time
- Use climate chamber to ensure temperature stability

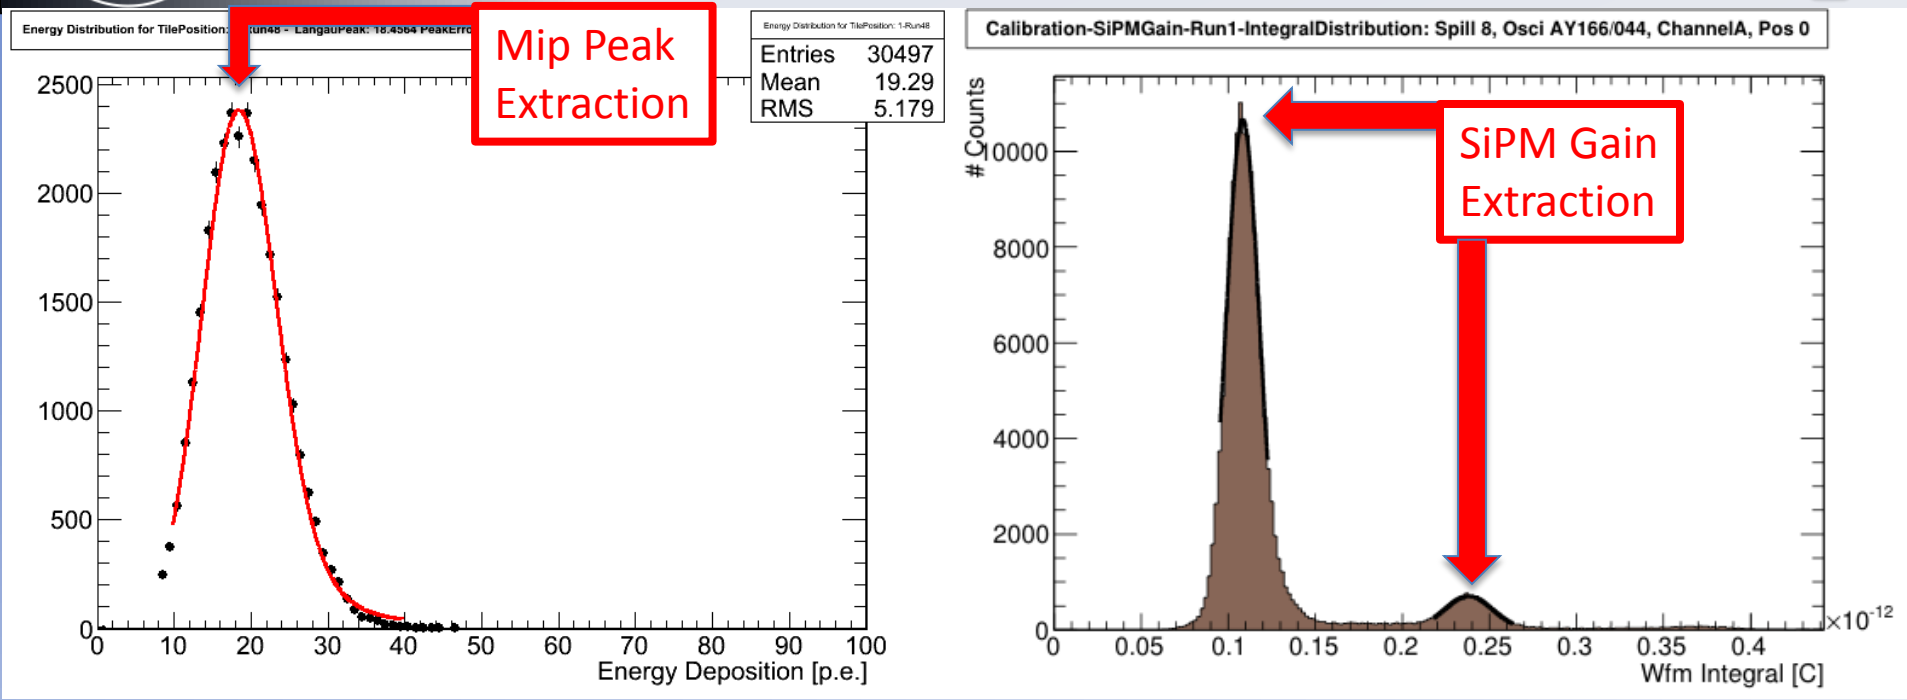

GEANT4 Simulation:
MPV (mu) = MPV(e)*0.825

Note: Electrons are no perfect MIPs → need scale factor

T3B Calibration to the MIP Scale: Sr90 Data

Simultaneous extraction of
SiPM Gain and **most probable value**
of energy deposition of Sr90 electrons

The Time Integration Window

The MPV is very sensitive on the Time Integration Window

→ Dominant effect: SiPM Afterpulsing

- Separate afterpulsing from energy depositions
- Study the effect of afterpulsing

The Time Integration Window

The MPV is very sensitive on the Time Integration Window

→ Dominant effect: SiPM Afterpulsing

- Separate afterpulsing from energy depositions
- Study the effect of afterpulsing

The Time Integration Window

The MPV is very sensitive on the Time Integration Window

→ Dominant effect: SiPM Afterpulsing

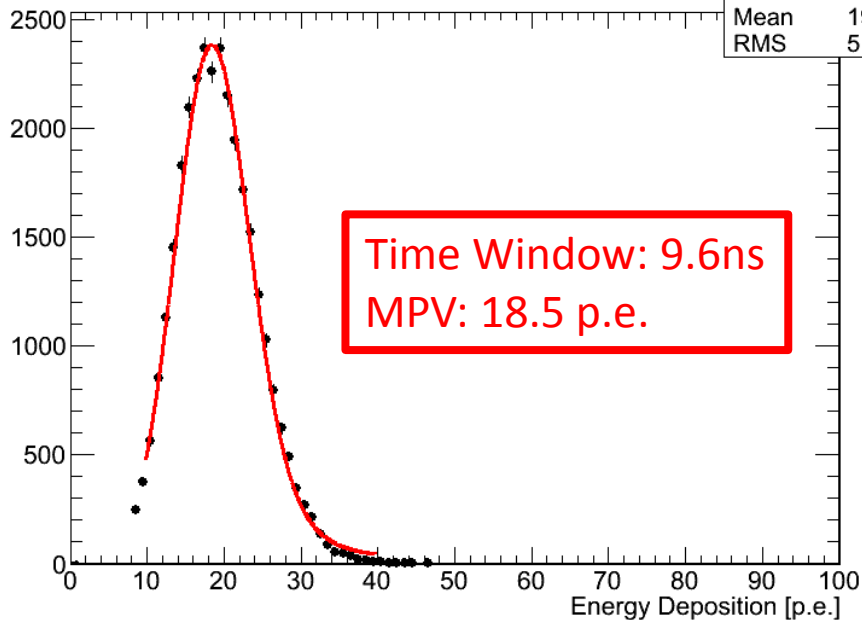

- Separate afterpulsing from energy depositions
- Study the effect of afterpulsing

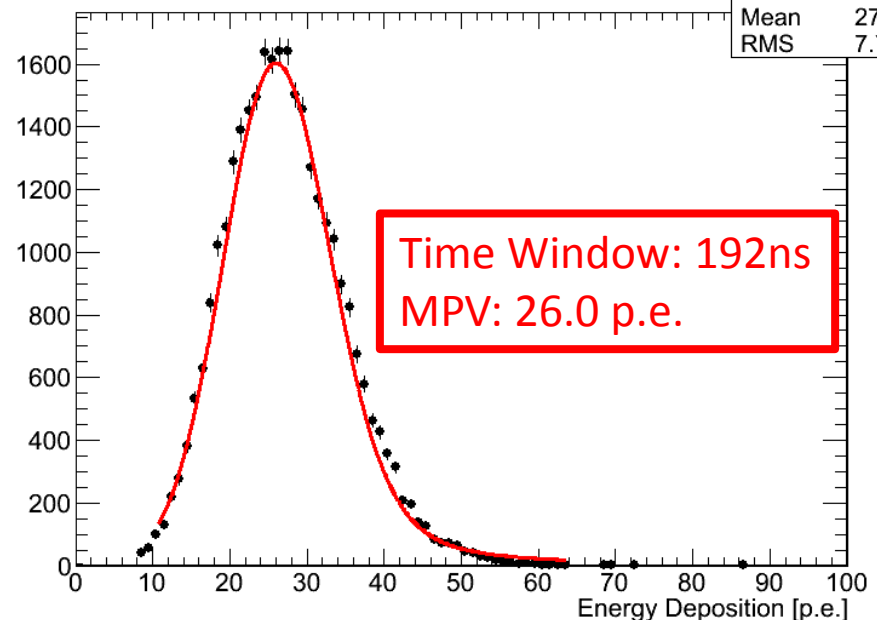

The Time Integration Window

Energy Distribution for TilePosition: 1-Run48 - LangauPeak: 18.4564 PeakError: 0.0508243 Chi2: 424.995 NDF: 26

Energy Distribution for TilePosition: 1-Run48 - LangauPeak: 26.0374 PeakError: 0.0684967 Chi2: 1418.58 NDF: 49

The MPV is very sensitive on the Time Integration Window

→ Dominant effect: SiPM Afterpulsing

- Separate afterpulsing from energy depositions
- Study the effect of afterpulsing

The Effect of Afterpulsing

Bias Voltage Scan for one T3B
“Master Tile”
One Measurement for
all other T3B tiles

Time Window	MPV-Gain dependence
9.6 ns	linear
307.2 ns	quadratic

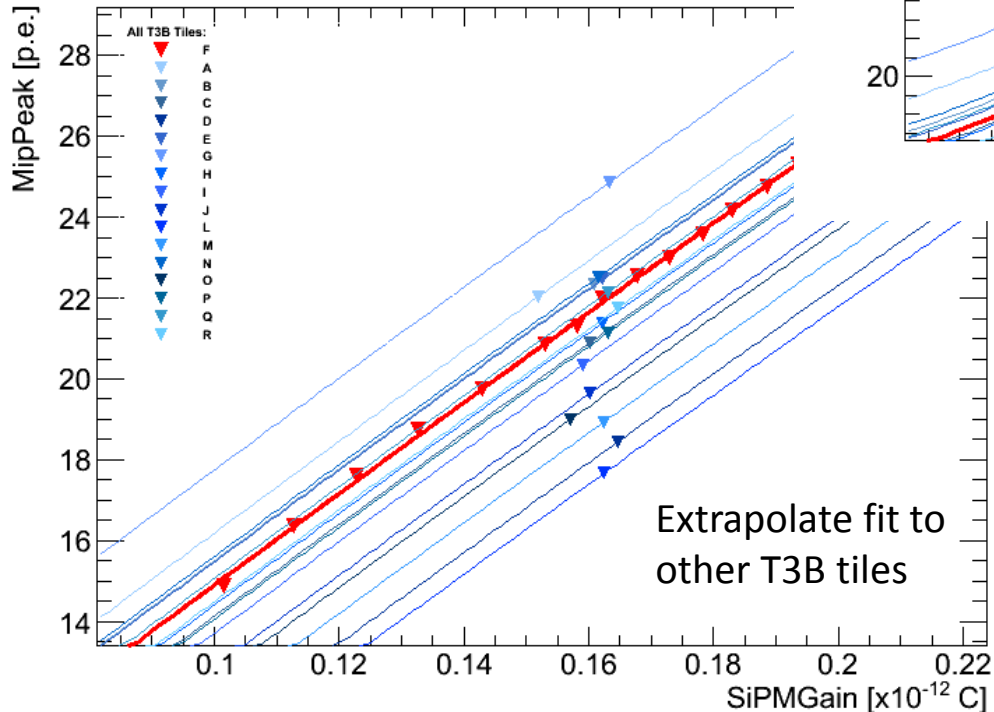

The Effect of Afterpulsing

Bias Voltage Scan for one T3B
"Master Tile"
One Measurement for
all other T3B tiles

Time Window	MPV-Gain dependence
9.6 ns	linear
307.2 ns	quadratic

The Effect of Afterpulsing

Bias Voltage Scan for one T3B
“Master Tile”
One Measurement for
all other T3B tiles

Time Window	MPV-Gain dependence
9.6 ns	linear
307.2 ns	quadratic

Interpretation:

1. More afterpulsing is integrated
→ would just result in a constant offset
2. Higher Gain
→ Afterpulsing and Crosstalk probability increased
→ Increased MPV dependence

Needs to be taken into account in Calib

The Effect of Afterpulsing

Time Window

9.6 ns

307.2 ns

Sr90 Calibration Data - Langau MPV vs. Gain

$\times 10^{-12}$ C]

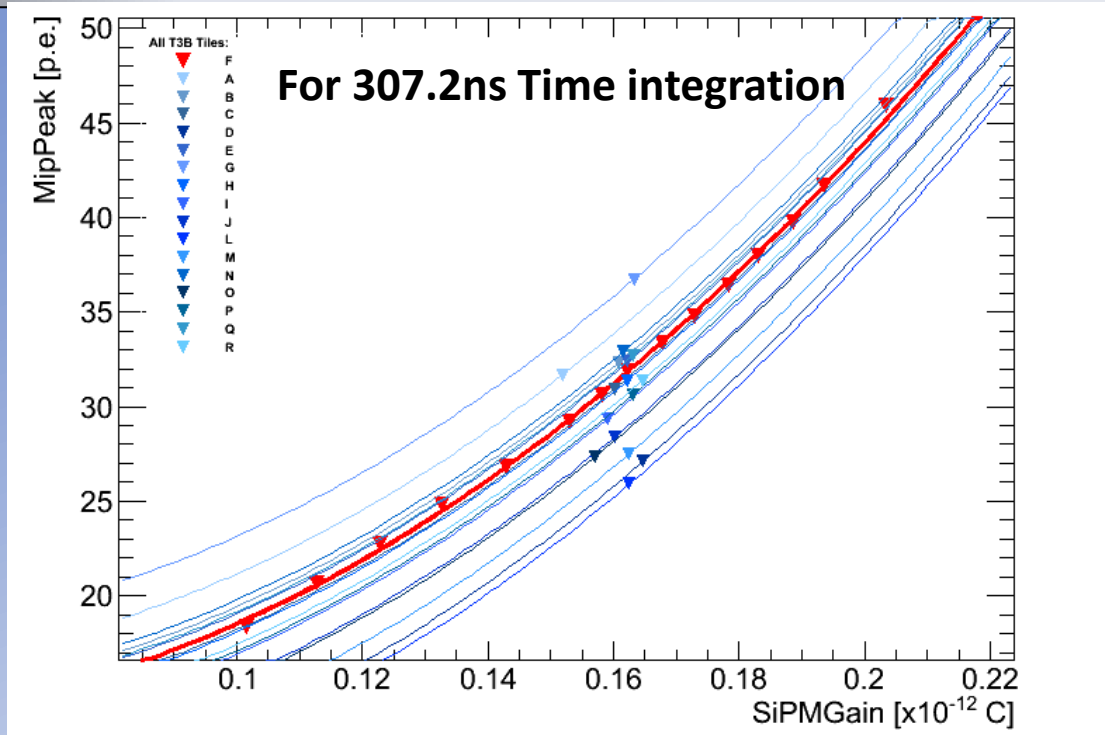

grated
stant offset

stalk
d

→ Increased MPV dependence
Needs to be taken into account in Calib

T3B Calibration to the MIP Scale

Obtain a dictionary:

Determine live SiPM Gain from testbeam data

Select MPV-Gain dependence for distinct time integration window

Obtain corresponding MPV of MIP distrib.

T3B Calibration to the MIP Scale

Obtain a dictionary:

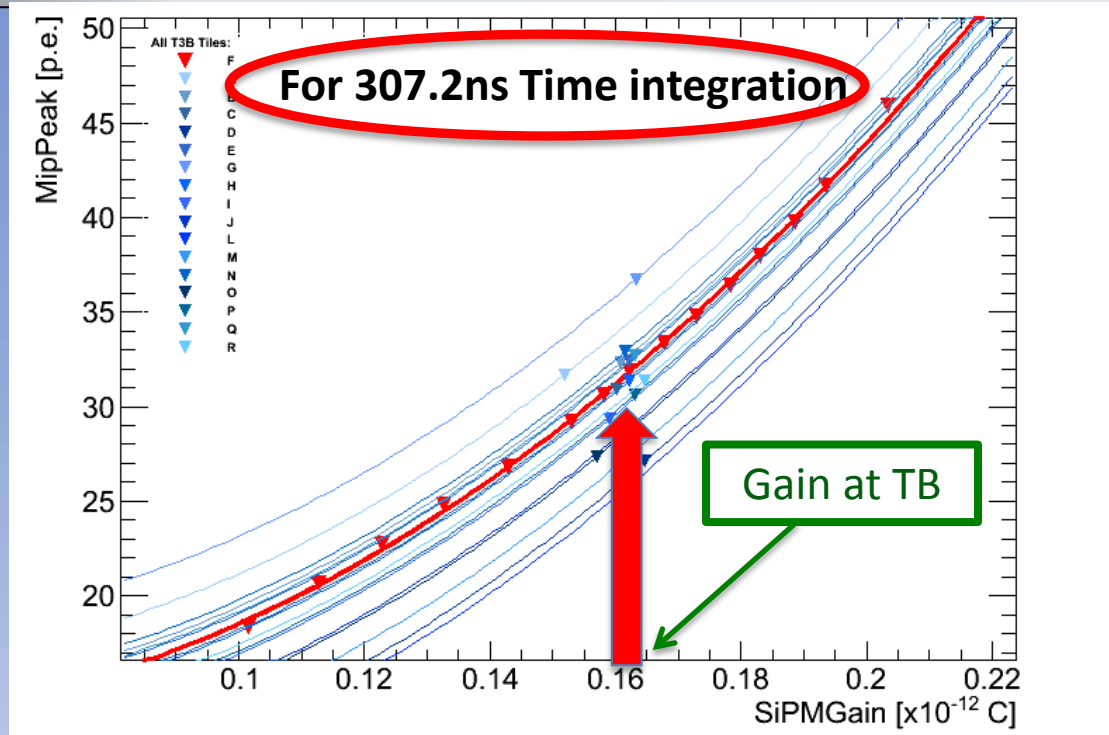

Determine live SiPM Gain from testbeam data

Select MPV-Gain dependence for distinct time integration window

Obtain corresponding MPV of MIP distrib.

T3B Calibration to the MIP Scale

Obtain a dictionary:

Determine live SiPM Gain from testbeam data

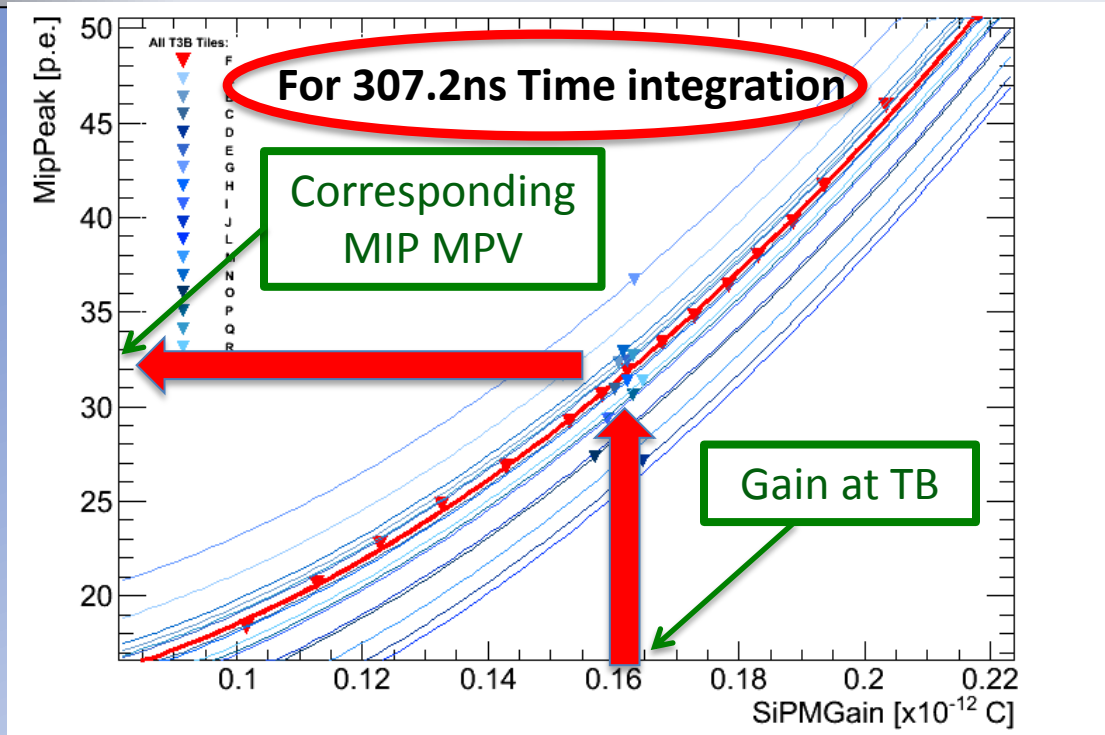

Select MPV-Gain dependence for distinct time integration window

Obtain corresponding MPV of MIP distrib.

T3B Calibration to the MIP Scale

Obtain a dictionary:

Determine live SiPM Gain from testbeam data

Select MPV-Gain dependence for distinct time integration window

Obtain corresponding MPV of MIP distrib.

VERIFY CALIBRATION PRINCIPLE: TESTBEAM MUON DATA

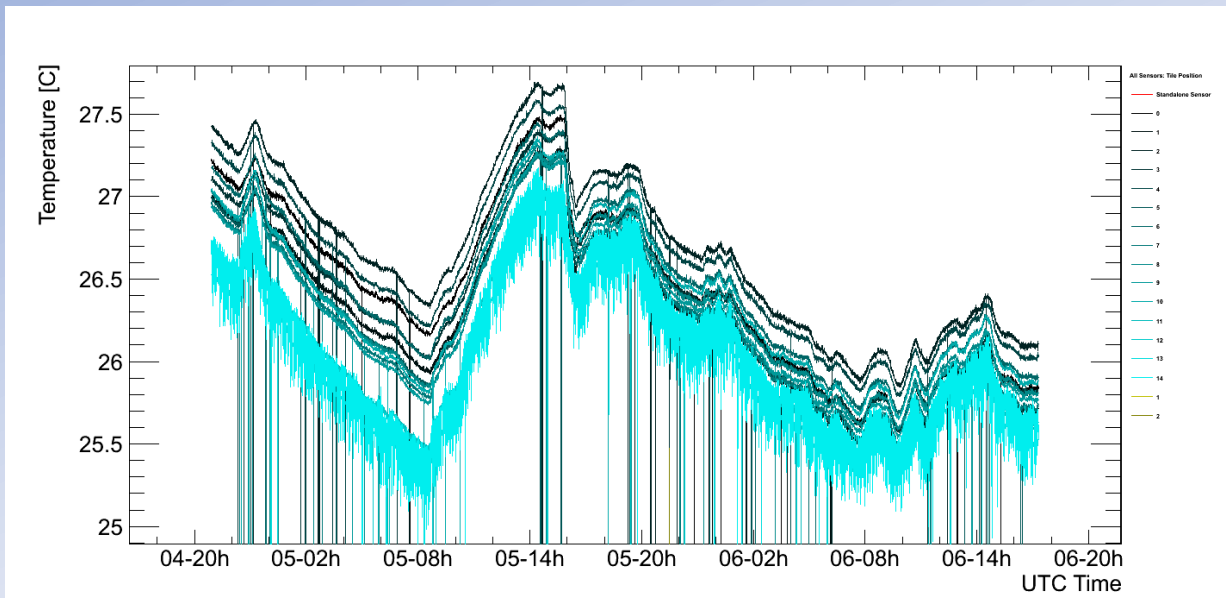

Verification of the Calibration

Principle: Muon Data

During the commissioning of the SDHCAL we could take an excessive amount of muon data:

- 14 mio Muon Events
- 40 hours without interruption
- Day-night-cycle Temperature Range: $\sim 25.5\text{C}$ to 27.5C
- Enough to extract the Mip MPV-Temperature dependence
- Then: Apply correction factor from Sr90 Data to eliminate the dependence (remember: We assume the MPV depends in first order only on the SiPM gain)

Verification of the Calibration

Principle: Muon Data

- T3B tiles hit in a small fraction of triggers
→ Determine MIP MPV every 200k events
- Time window of 9.6ns selected

Verification of the Calibration

Principle: Muon Data

- Time window of 9.6ns

Verification of the Calibration

Principle: Muon Data

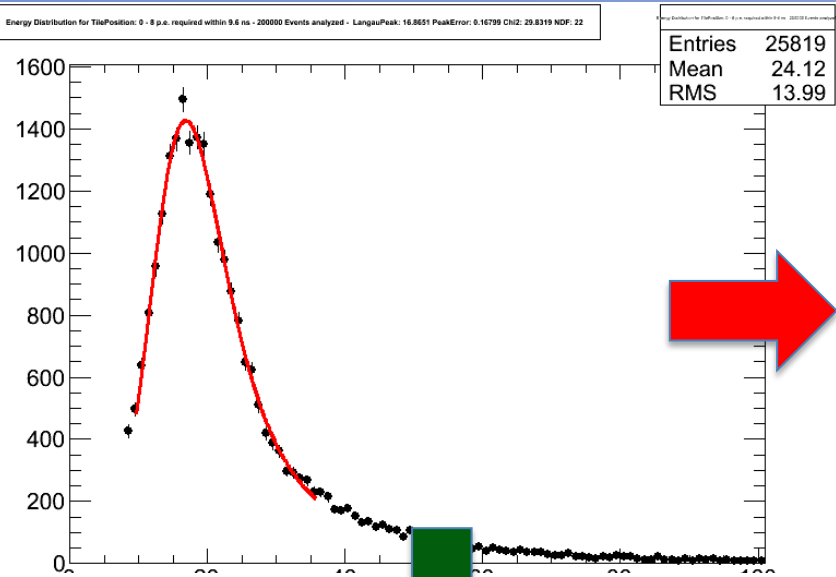

- Time window of 9.6ns

T3B Tile	MPV Drop	Slope
Center	-2.9 %/K	-0.5 p.e./K
Center + 1	-3.0 %/K	-0.48 p.e./K

Verification of the Calibration

Principle: Muon Data

- Time window of 9.6ns

T3B Tile	MPV Drop	Slope
Center	-2.9 %/K	-0.5 p.e./K
Center + 1	-3.0 %/K	-0.48 p.e./K

- Get live gain from Intermediate RM
- Determine corresponding Sr90 MPV
- Choose default MPV of 20 p.e. → later 1MIP
- Obtain Correction factor

Verification of the Calibration

Principle: Muon Data

- Time window of 9.6ns

Corrected MPV-Temperature dependence

Calibration results in efficient elimination of the dependence

Note: Corrected MPV values at ~16.5 p.e., not at the 20 p.e. we corrected to.

Interpretation: 0.825 is the Sr90 ↔ Muon MPV conversion factor

Matches simulations → Experimental proof

ROADMAP

Roadmap: Missing Calibration Steps

- SiPM Saturation correction:

Very promising results from Marco
with Wuppertal LED board and T3B tiles

Roadmap: Missing Calibration Steps

- SiPM Saturation correction:

Very promising results from Marco with Wuppertal LED board and T3B tiles

- Correction for Afterpulsing:

- Need a dictionary: Which pulse height causes on average which afterpulsing contribution at a certain time after the initial pulse?
- Promising results by Simon (also correction for darkrate)

Roadmap:

Missing Calibration Steps

- SiPM Saturation correction:

Very promising results from Marco with Wuppertal LED board and T3B tiles

- Correction for Afterpulsing:

→ Need a dictionary: Which pulse height causes on average which afterpulsing contribution at a certain time after the initial pulse?
→ Promising results by Simon (also correction for darkrate)

- Clipping Correction:

Waveform decomposition can only work up to +/-200mV range with an 8bit ADC
→ Higher energy depositions clipped
→ Original waveform probably recoverable from the signal shape

Roadmap: Run Quality Checks

T3B is a very high statistics experiment → need to concatenate all Runs at one energy

Processing power is no issue: Analyze ~ 15min/million events on a standard CPU

Developing procedure to identify suboptimal run conditions:

- CALICE Runlog → by eye ☹️
- Use Particle ID (from Cerenkovs), Beam profile
→ needs T3B-Calice synchronization for most of the data → Lars ongoing...
- T3B Hardware (e.g. pedestal jumps...) → automated “Calibration Quality Check” exists

Roadmap: Run Quality Checks

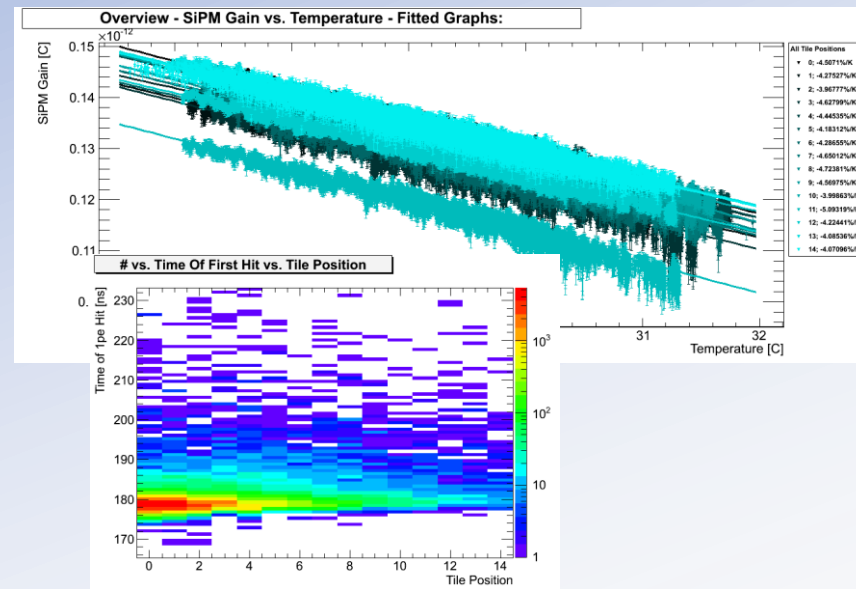

T3B is a very high statistics experiment → need to concatenate all Runs at one energy

Processing power is no issue: Analyze ~ 15min/million events on a standard CPU

Developing procedure to identify suboptimal run conditions:

- CALICE Runlog → by eye ☹️

- Use Particle ID (from Cerenkovs), Beam profile
→ needs T3B-Calice synchronization for most of the data → Lars ongoing...
- T3B Hardware (e.g. pedestal jumps...) → automated “Calibration Quality Check” exists

Final step → obtain timing results that are bullet proof

- Energy deposition vs. time
- Shower timing vs. particle energy
- Longitudinal timing of hadron showers
- ...

There is still big potential in the T3B data → we look forward to a successful year 2012

BACKUP

Fig. 1. Dependence of the dark noise rate, cross-talk probabilities and after-pulsing parameters on over-voltage and temperature, measured by triggering on thermally generated pulses
