

## Problems Lecture 1: Linac Basics

- 1) Calculate the relative longitudinal motion of two electrons with an energy of 9 GeV and a difference of 3% over a distance of 21 km.
- 2) Calculate the solutions to Hill's equation for  $K(s) = K_0 > 0$ .
- 3) Calculate the solutions to Hill's equation for  $K(s) = 0$  assuming  $\beta(s=0) = \beta_0$  and  $\beta'(s=0) = 0$ . (Only for the accelerator experts)
- 4) How much energy is roughly stored in one ILC cavity at nominal gradient?

## Solutions: Linac Basics

1) We calculate

$$\gamma = \frac{E_0}{mc^2} \approx \frac{9 \text{ GeV}}{0.511 \text{ MeV}} \approx 18000$$

then we use

$$\gamma = \frac{1}{\sqrt{1 - \beta^2}}$$

to find an approximation for  $\beta$

$$\beta \approx 1 - \frac{1}{2\gamma^2} \approx 1 - 1.5 \times 10^{-9}$$

over the length of a linac 21 km the longitudinal delay compared to light is  $\approx 32 \mu\text{m}$  for two particles which have a energy difference of  $\Delta\gamma$  the relative longitudinal motion would be

$$\beta_1 - \beta_2 \approx \frac{1}{2\gamma^2} - \frac{1}{2(\gamma + \Delta\gamma)^2} \approx \frac{\Delta\gamma}{\gamma^3}$$

for an example of 3% the motion is  $\approx 1.94 \mu\text{m} \ll \sigma_z$

Note: Due to the acceleration the effect is even smaller

## Solutions: Linac Basics

2) We use  $K(s) = \text{const} > 0$ .

- We know the solution is a harmonic oscillation with a fixed amplitude

$$x = A \cos(\phi(s) + \phi_0)$$

for the beta-function this should correspond to a constant value of beta, which we call  $\beta_0$

- We now need to check that this fulfills the differential equation for  $\beta$

• Ansatz:  $\beta = \beta_0$ ,  $\beta' = 0$  and  $\beta'' = 0$ :

$$\begin{aligned} \frac{\beta''\beta}{2} - \frac{\beta'^2}{4} + K\beta^2 &= 1 \\ \Rightarrow K\beta_0^2 &= 1 \end{aligned}$$

Hence

$$\beta_0 = \frac{1}{\sqrt{K}}$$

Now one can plug this into the equation of motion to see that one recovers the known solution for a harmonic oscillator.  $\epsilon$  is defined by the initial condition.

## Solutions: Linac Basics

3)  $K = 0$

$$x = x_0 + x'(0)s$$

Ansatz:  $\beta$  is a polynomial of second order

- We use  $\beta'(s=0) = 0$ ,  $\beta(s) = \beta_0 + \frac{s^2}{\beta_0}$

$$\begin{aligned}\frac{\beta''\beta}{2} - \frac{\beta'^2}{4} + K\beta^2 &= 1 \\ \Rightarrow \frac{\beta''\beta}{2} - \frac{\beta'^2}{4} &= 1 \\ \Rightarrow \frac{1}{2} \left( \beta_0 + \frac{s^2}{\beta_0} \right) \left( \frac{2}{\beta_0} \right) - \frac{1}{4} \left( \frac{2s}{\beta_0} \right)^2 &= 1 \\ \Rightarrow 1 + \frac{s^2}{\beta_0^2} - \frac{s^2}{\beta_0^2} &= 1\end{aligned}$$

4) Assuming  $R/Q = 1 \text{ k}\Omega$  we find approximately 120 J

$$E = \frac{(GL)^2}{2\pi f_{RF} R/Q}$$
