## I.PURPOSE

## WHY NEED GAS TEST ?

The chamber gas plays important roles in order to measure the position of tracks.

The gas decide three parameters.
I. velocity of drifting electrons
2. diffusion constant of drifting electrons ( $C_{D}$ )
3. the effective number of seed electrons $\left(\mathrm{N}_{\text {eff }}\right)$

## PURPOSE OF OUR STUDY

According to GARFIELD,
$\mathrm{CF}_{4}$ gas mixtures are likely to give low $\mathrm{C}_{\mathrm{D}}$. But, ...
problem
$\mathrm{CF}_{4}$ gas mixtures are not yet fully studied as GEM-TPC gas.

Our task is to confirm whether these gases can become GEM-TPC gas.

## 2.THISWORK

## THIS WORK <br> ~cosmic ray test~

We tested $\mathrm{Ar}^{-} \mathrm{CF}_{4}$-isoC4 $\mathrm{H}_{10}(94: 3: 3)$ with GEM-TPC as a first step, (Source was cosmic ray) and estimated $\mathbf{V}_{\text {drift }}, \mathbf{C}_{\mathrm{D}}$ (transverse) and $\mathbf{N}_{\text {eff }}$.

And we compared our measurement with GARFIELD in $V_{\text {drift }}$ and $C_{D}$.

## PROBLEMS IN <br> DATA ANALYSIS

This is one of the histograms which shows

drift distance Z-distribution of "seed electrons". We estimated $\mathrm{V}_{\text {drift }}$ from this. (Drift distance shoud be TPC length.)

Here, there are two problems.
I. What's the gap at left side ?
2. What's the value of the end point?
(right side)

## OUR ACTION FOR THE PROBLEMS I

Where's the right side end ?

The right edge is slightly-tilted.
So we define the end point as follows.
I. fit the edge as $y=$
$a_{0}$
(Red Line)
$\exp \left[\frac{x-a_{1}}{a_{2}}\right]$
2. let the end point $=a_{1} \pm 2 a_{2}$
(Blue Region)

## OUR ACTION FOR <br> THE PROBLAMS 2

- What's the gap at left side ?

500ns_delay

We tested with delayed trigger gate.
Histograms were expected to move to the left because of the trigger delay.

Result ( left figure )
-Right edge moved reasonably.

- No change was seen with Left edge.

From this result, we take the left gap as something like "invisible region".

## NEW PROBLEM ~To calibration by PIO~

Where is $T_{0}$ ?
We calibrated $\mathrm{T}_{0}$ by using PI0 gas.

"invisible region"

|  | our <br> measurement | Garfield |
| :---: | :---: | :---: |
| $C_{D}$ | $\\| 3 \pm 4.8$ | $\\| 6.7$ |
| $V_{\text {drifit }}$ | $?$ | 5.37 |

## ASSUMPTION

Pl0 gas give also some consistency in $\mathrm{V}_{\text {drift. }}$.
$\mathrm{V}_{\text {drift }}(\mathrm{PIO} @ \mathrm{E}=108.5[\mathrm{~V} / \mathrm{cm}])=5.37 \pm 0.30$
We estimate $\mathrm{T}_{0}$ by analysis for PIO.

P10

PIO.

Fig. 4. Calibration in P10.

## NEW PROBLEM ~To calibration by PIO~

Where is $T_{0}$ ?
We calibrated $\mathrm{T}_{0}$ by using PI0 gas.

"invisible region"

|  | our <br> measurement | Garfield |
| :---: | :---: | :---: |
| $C_{D}$ | $\\| 3 \pm 4.8$ | $\\| 6.7$ |
| $V_{\text {drifit }}$ | $?$ | 5.37 |

## ASSUMPTION

Pl0 gas give also some consistency in $\mathrm{V}_{\text {drift. }}$.
$\mathrm{V}_{\text {drift }}(\mathrm{PIO} @ \mathrm{E}=108.5[\mathrm{~V} / \mathrm{cm}])=5.37 \pm 0.30$
We estimate $\mathrm{T}_{0}$ by analysis for PIO.

## SUMMARY OF OUR ACTION

FOR THE PROBLEMS ~analysis procedure~

I. Obtain the value of end point( $\left.Z_{\text {end }}\right)$ by fitting the right edge.
2. Obtain Z-offset
by using $\mathrm{T}_{0}$ from PIO test.
3. Obtain drift-length(Lmeasure) from I, 2.
4. Calibrate $V_{\text {drift }}$ to make consistency in $L_{\text {measure }}$ and $L_{\text {true. }}$

$$
\left(\mathrm{L}_{\text {true }}=254 \mathrm{~mm}\right)
$$

As a result, $\mathrm{V}_{\text {drift }}$ includes error originated from

## 3.RESULTS

## Ar-CF4-iso C4HIO(94:3:3) TEST

We tested the following condition.
$\mathrm{E}=80,100,120,135,150[\mathrm{~V} / \mathrm{cm}] \quad \mathrm{B}=1[\mathrm{~T}]$

## RESULTS

| $E[V / c m]$ | $N_{\text {eff }}$ | \# of tracks |
| :---: | :---: | :---: |
| 80 | $23 \pm 6$ | $\sim 21,000$ |
| 100 | $21 \pm 8$ | $\sim 18,000$ |
| 120 | $25 \pm 9$ | $\sim 17,000$ |
| 135 | $24 \pm 9$ | $\sim 16,000$ |
| 150 | $21 \pm 2$ | $\sim 64,000$ |

No Problem with Electron Attachment

## COMPARISON TO GARFIELD <br> $\simeq$ DriftVelocity $\sim\left(\right.$ Ar-CF $_{4}$-isoC $\mathrm{C}_{4} \mathrm{H}_{10}(94: 3: 3)$

## COMPARISON TO GARFIELD <br> 

## 4.SUMMARY

## SUMMARY

We tested Ar-CF4-isoC4HIO(94:3:3) as GEM-TPC gas, (cosmic-ray test, $\mathrm{E}=80,100,120,135,150[\mathrm{~V} / \mathrm{cm}], \mathrm{B}=1[\mathrm{~T}]$ )
and
compared with GARFIELD.

## CONCLUSIONS

We can confirm Ar-CF4-isoC4 $_{4} \mathrm{H}_{10}$ (94:3:3) work as GEM-TPC gas
@E=80~150[V/cm]
( $N_{\text {eff }}$ seems to be O.K.)
Discrepancy can be seen between our results and garfield. (especially at high electric field)

## 5.PLANS

## PLANS

Bito-san(TUAT) is going to measure $\mathrm{V}_{\text {drift }}$ in our condition independently. So, we'd like to compare the results to ours.

- Test with other E,B field , same gas

$$
\begin{aligned}
& \mathrm{E}=50,180, \ldots[\mathrm{~V} / \mathrm{cm}] \\
& \mathrm{B}=0[\mathrm{~T}]
\end{aligned}
$$

- Test with other gases

$$
\begin{aligned}
& \text { Ar-CF4-isoC4HIO(95:3:2) } \\
& \text { Ar-CF4-isoC4HIO(96:3:I) }
\end{aligned}
$$

Study about advantage of
CF4 gas mixtures
