IWLC, Geneva, October 2010

Mikael Berggren (DESY-HH) Report from Common Task Group for General

IWLC 2010 1 / 19

Outline

The charge

Old and new schemes

3 Whizard

Decisions

- 5 Whizard improvement
- 6 Common Samples

7 Conclusions

• • • • • • • • • • • •

Paris and Beijing

At the ILD meetings in Paris and Beijing, plans for future mass-production for bench-marking, detector optimisation and physics analyses were discussed.

Three areas needing development before we would start were identified:

- Developments on detector simulation (all options equally advanced, more realism, integration with engineering designs)
- Amelioration in reconstruction, mainly tracking.
- Updating event-generation.

The third of these is the charge of Common Task Group for Generators.

Common Task Group for Generators

A cross-region and cross-concept working group was created to look into the generator side Members

- Tim Barklow, SiD/Americas
- Akiya Miyamoto.ILD/Asia
- M.B., ILD/Europe
- Since, CLIC has also joined
 - Stephane Poss
 - Marco Battaglia

Mikael Berggren (DESY-HH)

How was it done for the LOI ?

• Basically, all done

- At one place (SLAC)
- By one person (Tim)
- With one generator (Whizard 1.40)
- In addition, some signal samples were done elsewhere by other people (N. Wattimena, P. Schade, Nicola d'Ascenzo, M.B. ...) and with different Whizard versions.
- In ILD, the generated files were ftp:ed from SLAC, stored on the grid, entered into the database, and used as input to Mokka+Marlin. Once again, by one person (I. Marchesini).

Why not do the same ?

• Tim will not do it alone, due to his work-load

- There are a number of short-comings with the version of Whizard used:
 - Diagonal CKM
 - No tau polarisation in decays
 - Hadronisation tune in PYTHIA
 - · Colour-flow and helicity information
- Whizard is not ideal for some specific channels which might need other generators:
 - SUSY
 - γγ/ mini-jets
 - > 6 fermions
 - bhabha
 - tth, ttz, ttbb
 - 0 ...

- For the DBD, there are new bench-marks
- at other *E_{CMS}*
- The Baseline Assessment issue has been added to the list of tasks. Time-line
 - 1st BAW in Sep (KEK) and 2nd BAW in mid. Jan (SLAC).
 - Physics/Detector groups are expected to provide a report by 2nd BAW.
- Machine backgrounds should be treated more in detail.
- The LHC runs.

This leads to a number of items to decide on/develop:

- Work sharing:
 - Be able to run production-scale Whizard at KEK's local computer, the DESY's NAF, or the ILC-VO GRID.
 - Tools for mass production.
 - Manage generated samples: Storing generated files, documentation, knowing they will be used by both SiD and ILD, ie. by different production systems.
- Develop a plan for MC sample generation for DBD and ILC baseline assessment work
- Signal samples: What and How?
- SM background samples: What and How?
- Beam backgrounds: What and How?

Initial working meeting at SLAC (Tim, Akiya, MB) in May.

Whizard combines

- Matrix-element calculation (O'Mega, MadGraph or CompHEP; we use O'Mega),
- Phase-space calculation.
- Multi-channel integration
- into an efficient generator of un-weighted events. Features:
 - Treats up to 6 particles in the final state
 - Does not separate "signal" and "background" sources of the final state → interference correctly treated.
 - Keeps track of polarisation.
 - Knows about beam-strahlung and ISR, hence varying initial-state properties.
 - NB. hadronisation and eg. τ-decays are not treated by Whizard, but by external programs, supplied by the user.

Whizard combines

Mikael Berggren (DESY-HH) Report from Common Task Group for General

• We use PYTHIA for fragmentation and decays.

- Note that PYTHIA doesn't know about polarisation (*τ*:s, charginos, ... !). Use TAUOLA instead.
- Many models (SM and beyond) known. NP parameters read from LesHouches file.

- Many channels: SM alone is made of 2348 distinct Whizard channels...
- Non-perturbative processes, eg. $\gamma\gamma$ beyond multi-peripheral.
- Highly singular phase-space, eg. Bhabha:s
- Eg. low-mass SUSY gets very complicated. SPS1a': 13 open production channels open, 49 decay-channels (40 of which are SUSY cascades), 100's of final states, many with > 6 fermions.
 CLIC: > 6 fermions, beyond top-pairs ?

- We use PYTHIA for fragmentation and decays.
- Note that PYTHIA doesn't know about polarisation (*τ*:s, charginos, ... !). Use TAUOLA instead.

SM will be done with Whizard

• Whizard version by choice : 1.95. Has

- CKM correct
- Colour flow
- Spin
- Latest version at the time of the decision was 2.0.2, but "Note that some of the features of WHIZARD 1 (esp. ILC) have not yet been re-enabled." (Whizard home-page).
- Fragmentation: Latest PYTHIA6 (6.422). PYTHIA8 is out but "To some extent this switch is nominal, since 8.1 does not yet offer a complete replacement of 6.4, and is not yet tested and tuned enough to be recommended for major production runs." (PYTHIA home-page).

イロト イ団ト イヨト イヨト

Technical issues needed to be solved to be site-independent:

- Whizard used to need to be compiled with Intel's commercial Fortran compiler ifort, but bleeding edge GNU gfortran (gcc 4.3) works. Does not link with code compiled with gcc 4.1 (default in SLC5) ⇒ need to recompile other packages as well.
- Previously, all was done on 32-bit systems, but as 64-bit ones are getting increasingly wide-spread, it would be preferable that all is checked to run on 64-bit as well ⇒ also CERNLIB needs to be compiled in 64-bit.

Other generators

Non-Whizard generation

- physim for tth, ttz, and ttbb events, needed for the QCD enhancement effect at threshold.
- SUSY generators.
 - Need full event, knowing about ILC conditions, having polarised decays. None of the alternatives (SUSYGEN, ISAJET and SHERPA) can do this better than Whizard
- Bhabha generator: investigate GRACE, contacted authors.
- γγ: PYTHIA. Tim has a consistent way to use PYTHIA instead of Whizard.
- Investigate Whizard-2.03: New format of input steering files makes a transition a mayor effort, and will not be pursued.

- PYTHIA 6.422 is used for hadronisation in order to use the LEP latest parameters, where we are currently evaluating input from DELPHI, ALEPH and OPAL.
- Tau-polarisation in decay: TAUOLA interface standardised, for polarisation-dependent *τ*-decays. Also for *τ*'s in fragmentation *W* → *τν*. Verified to work correctly - Thanks for advice Gudi!
- Extension of information in the event record:
 - Colour singlet system information and particle spin.
 - Beam-particles before and after beamstruhlung.
 - Process ID in each event record.
- Coding of FSR.
- Flavour-summed channels. After all, who cares if it is a u,d, or s quark ? Will reduce the 2348 channels to a few tens. Two options:
 - Sum in phase-space evaluation: Higher gain in simplicity and CPU-time,but less flexible.
 - Channel mixing in generation: Any set of channels can be merged.

- Tim's scripts to run Whizard jobs at the SLAC batch server migrated to the KEK environment, and to DESY.
- An SVN project holding installation scripts (by MB) and process-description files has been set up at CERN by Stephane.
- As generation production will now be distributed → need conventions and "database"
- SiD: Fermi Pipeline system fits well, but not migratable Tim is preparing the interface.
- For CLIC, Stephane has integrated to the generation into DIRAC from LHCb.
- Probably ILD will do something similar with the new production system.
- In any case: An information file with file-locations, generator settings, etc. should be updated by each generation job. A proposal by Akiya is on the table.

Common Samples

Plan for beam background samples

- By GuineaPig++, T. Hartin will do has done them for all beam-parameter sets given by GDE.
 - Disrupted beams
 - Beam-strahlung photons
 - Pairs.

The first two are used as input beam-spectra for Whizard, the third comes for "free". The 1 TeV Whizard input spectra are done (by Tim), the rest will follow.

- Other backgrounds with BDSIM. Help assured from experts (P.Bambade and T. Murayama), but definite beam design before it is useful to initiate work.
 - Synchrotron radiation.
 - Beam-halo muons.
 - Neutrons.
- Two-photon mini-jets. Done with PYTHIA. NB: 0.7 events/BX, when Real-Virtual and Real-Real contributions are included (10 times more than virtual-virtual alone)

- Two-photon mini-jets. Done with PYTHIA. NB: 0.7 events/BX, when Real-Virtual and Real-Real contributions are included (10 times more than virtual-virtual alone)

Samples for ILD's 350 GeV study

Aim: What can be done for a light Higgs if the ILC luminosity will be as low as the original SB2009 proposal ? At 350 GeV, SB2009 is guite similar to RDR. So:

- Check performance of Higgs branching ratio measurement.
- Compare with LOI study (at 250 GeV).

Signals needed:

• $H \rightarrow cc, H \rightarrow bb.$

Backgrounds needed:

- 4q final states, ($\mu\mu$ qq exists already, eeqq and $\tau\tau$ qq not needed.)
- Suggestion to produce 6 quarks (top pairs)

Beam parameters:

 sb2009-with TF as this is the widest. Rescale to RDR-350 or sb2009-without TF.

To be done with LOI generator and detector model.

Sample for ILD's 350 GeV study

Status:

- All samples generated by Akiya at KEK (4f, 6f, Hff).
- All have been put through the Mokka/Marlin-chain. They run fine.
- Tentative information record produced, that should serve as input to SiD:s or ILD:s production database.
- See:

http://wiki.kek.jp/display/ miyamoto/ILC+Common+Generator+Samples

< ロ > < 同 > < 回 > < 回 >

- The Common Task Group for Generators has been formed, and is working.
- Whizard, the main work-horse of the SM simulation, has been updated to the most current, ILC-usable version.
- Most issues on list of needed amelioration has been solved, both technical and physics ones.
- A full production of samples for the 350 GeV study has been done at KEK, with tools migrated from SLAC. However, this was done with the old generator.
- The way to feed information from generation to the production database must be designed and tested.
- Investigation of non-Whizard generators for special processes is on going, but not yet conclusive.
- Larger scale test of the new Whizard version and the new tune of fragmentation will be needed
