

Forward Calorimeters for ILC and CLIC detectors

Wolfgang Lohmann,
BTU and DESY

On behalf of the FCAL collaboration

Labs involved: Argonne, Vinca Inst, Belgrade, Bukharest IFIN-HH & ISS,
CERN, Univ. of Colorado, Cracow AGH-UST & IFJ-PAN,
JINR Dubna, NCPHEP Minsk, Santa Cruz,
Stanford University, SLAC ,
Tuhoku Univ., Tel Aviv Univ., DESY (Z.),
Pontificia Universidad Católica, Chile

ILD concept for ILC

LumiCal:

- precise luminosity measurement, 10^{-3} at ILC , 10^{-2} at 3 TeV

BeamCal (and Pair Monitor):

- hermeticity (electron detection at low polar angles),
- assisting beam tuning (fast feedback from BeamCal and pair monitor data to machine)

Challenges:

- radiation hardness (BeamCal),
- high precision (LumiCal) and
- fast readout (both)

Technology choice: Finely segmented compact calorimeters

BeamCal

LumiCal

- Tungsten thickness $1 X_0$, 30 layers
- BeamCal sensors GaAs, 500 μm thick
- LumiCal sensors silicon, 320 μm thick
- FE ASICs positioned at the outer radius
- BeamCal angular coverage 5.8 – 43.5 mrad
- LumiCal coverage 31 – 78 mrad

Luminosity:

$$\mathcal{L} = N / \sigma$$

Bhabha scattering:

Source	Value	Uncertainty	Luminosity Uncertainty
σ_θ	2.2×10^{-2} [mrad]	100%	1.6×10^{-4}
$\Delta\theta$	3.2×10^{-3} [mrad]	100%	1.6×10^{-4}
a_{res}	0.21	15%	10^{-4}
luminosity spectrum			10^{-3}
bunch sizes σ_x, σ_z ,	655 nm, 300 μm	5%	1.5×10^{-3}
two photon events	2.3×10^{-3}	40%	0.9×10^{-3}
energy scale	400 MeV	100%	10^{-3}
polarisation, e^-, e^+	0.8, 0.6	0.0025	1.9×10^{-4}
total uncertainty			2.3×10^{-3}

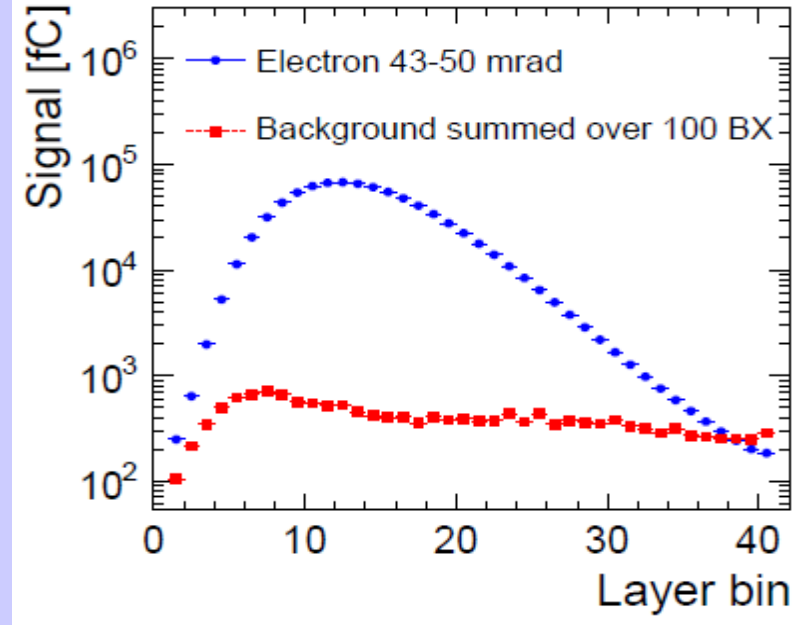

Laser alignment system (LAS) integrated in the QD0 alignment

* 100%= Upper limit – the size of effect is taken as uncertainty

CLIC challenges:

- Beam induced background in LumiCal (occupancy)
- Read-out speed (.5 ns between BX)
- Luminosity spectrum

The precise knowledge of the spectrum shape is essential for the precision of the luminosity measurement !!
 (how to determine -see talk by Andre Sailer)

LumiCal

p in n, strip pitch 2.2 mm

40 pieces, joint effort

IFJ PAN Cracow, DESY,
TAU

BeamCal

Compensated GaAs

~ 10 pieces,

Institute in Tomsk, DESY-JINR
collaboration (BMBF
supported)

SLAC/ Universidad Católica, Chile (BeamCal)

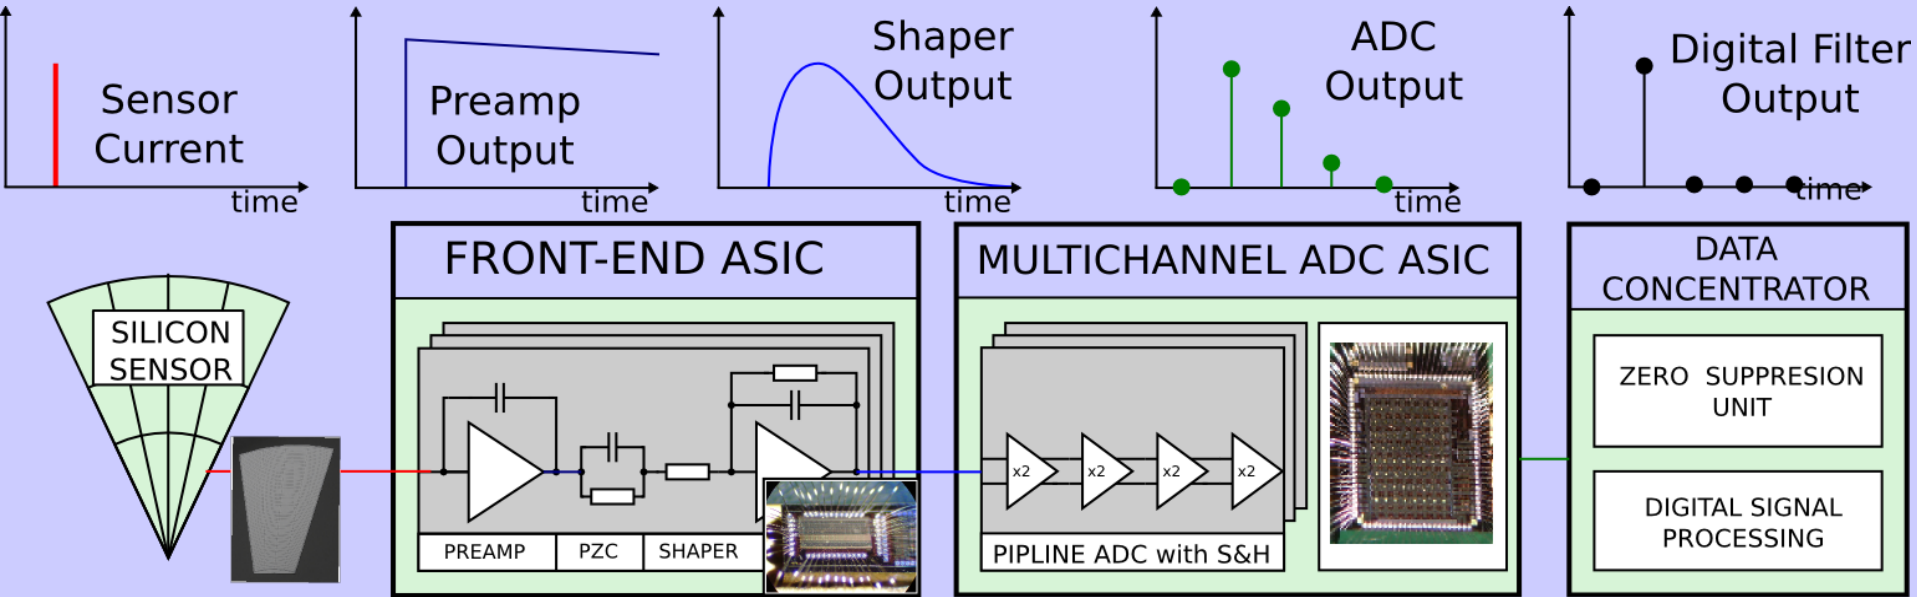

- Prototypes in 180-nm TSMC process
- Charge sensitive preamplifier
- Analog adder to provide fast feedback
- ADC : 10-bit SAR ADC
- Preparation for beam-test foreseen

Pair Monitor readout (Tohoku Univ.)

- Silicon On Insulator (SOI) technology – first The sensor and readout electronics are integrated in the SOI substrate. (monolithic)
- SOI 0.2 μm CMOS process
noise : 260 e^- (+130 e^-/pF) expected signal : 20000 e^-

AGH-UST 0.35 μm CMOS

8 channel Front-End ASIC

- $T_{\text{peak}} \approx 60 \text{ ns}$
- C_{det} up to 100pF
- switched gain: $\sim 2fC < Q_{\text{in}} < 10 \text{ pC}$
- RC and FET feedback

8 channel 10-bit ADC ASIC

- 1.5 bit pipeline architecture
- 25 Ms/s (9.7 ENOB)
- Power: $\sim 1.2 \text{ mW/chan/MHz}$
- Power pulsing embedded

Module Design

Data concentrator
Xilinx Spartan 3E

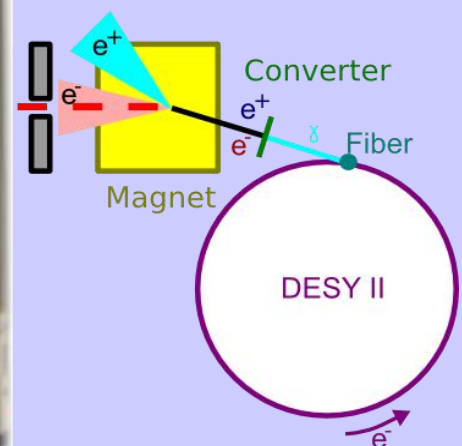

4 pairs of Front-end + ADC

LumiCal / BeamCal sensors

Test-beam Setup

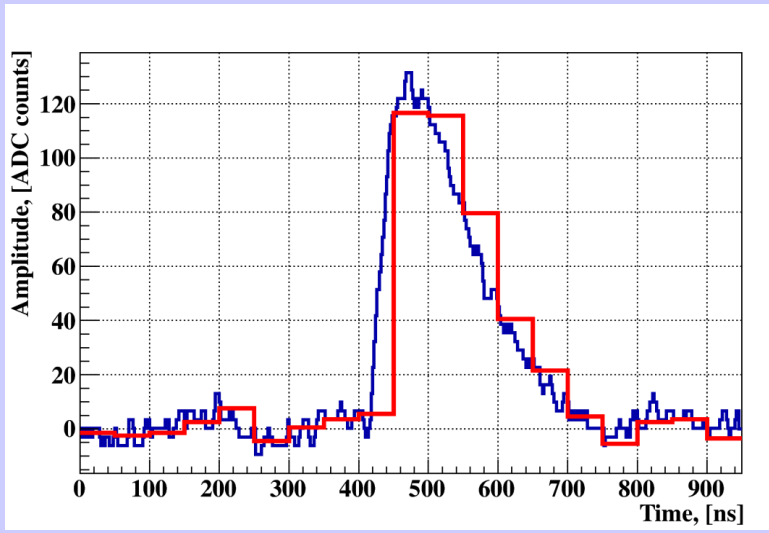

- 50×10^6 events recorded
- different areas of the sensor
- different FE settings
- data with FE and external ADC

32 channels fully equipped (Sensor + Front-end + ADC)

- Signal handshaking with Trigger Logic Unit (TLU)
- ADC Clock source
 - Internal (asynchronous with beam operation) – testbeam & CLIC mode
 - External (beam clock used to synchronize with beam) ILC mode
 - ADC sampling rate is up to 20 Ms/s (6.4 Gbps)

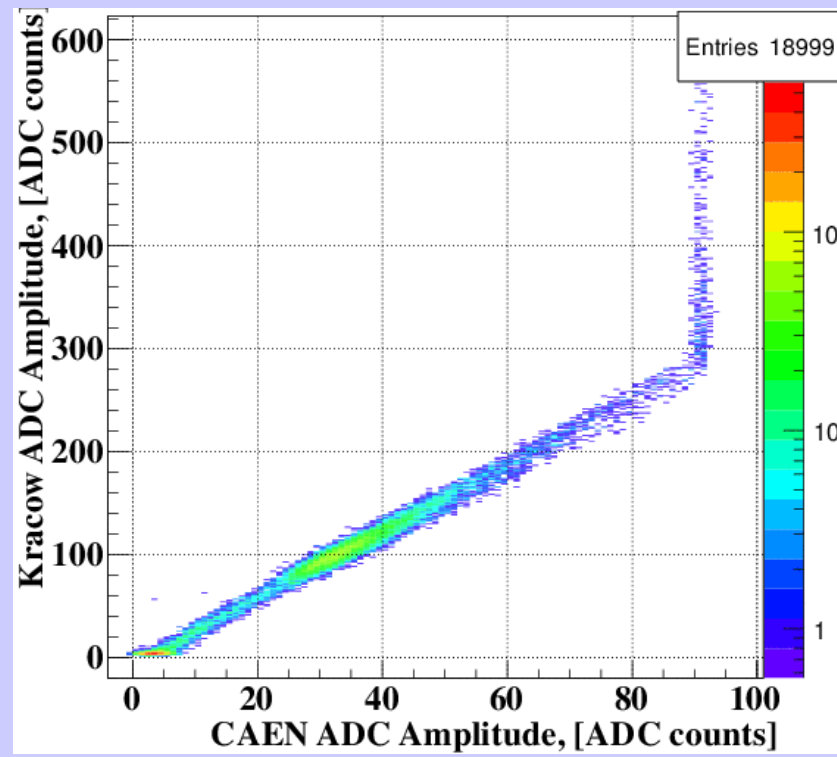

Test-beam Results

Example signal:
 Signal digitized with
 ADC ASIC (red) and
 external ADC (blue)

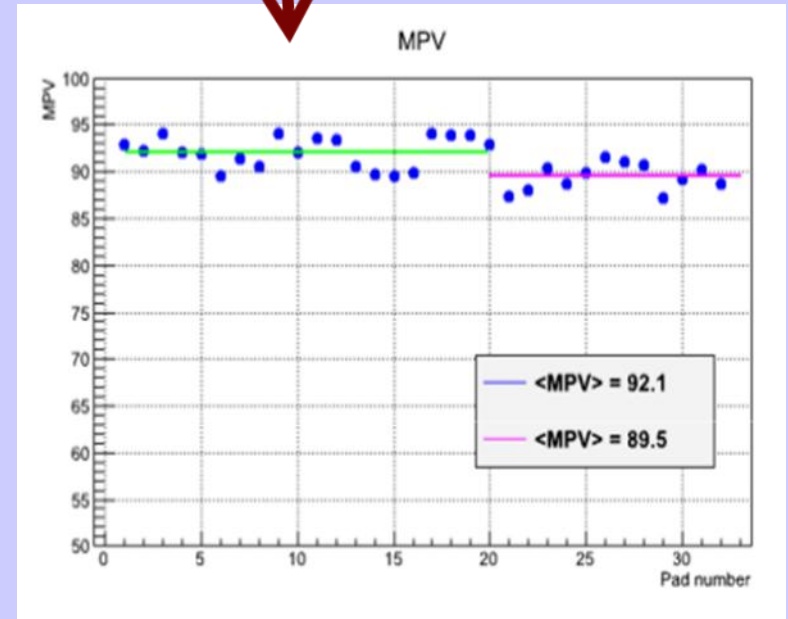

Comparison of the
 amplitude measured with
 the ADC ASIC and a
 CAEN 500 Ms/s flash ADC

S/N ~ 22 (RC feedback & FET feedback)

Gain vs. channel

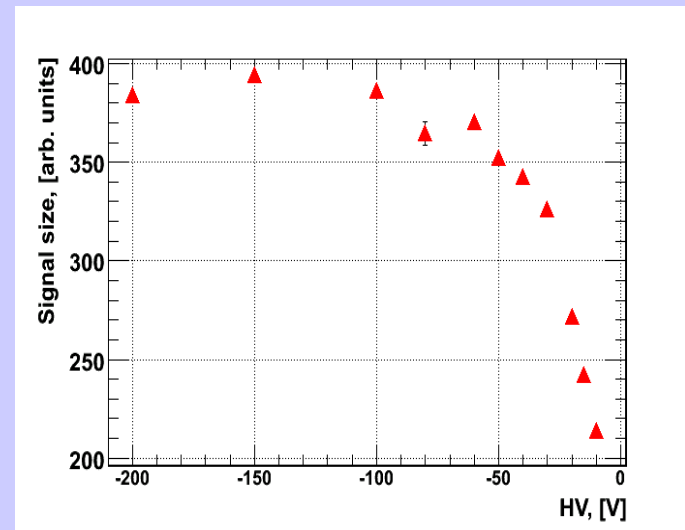

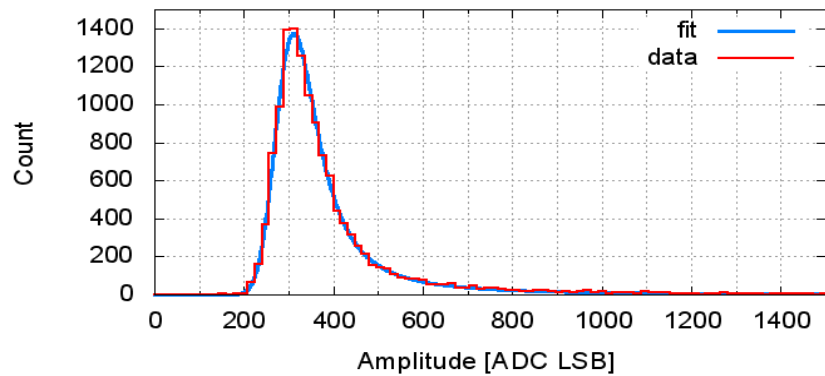

σ_{PED} as a function of the pad area

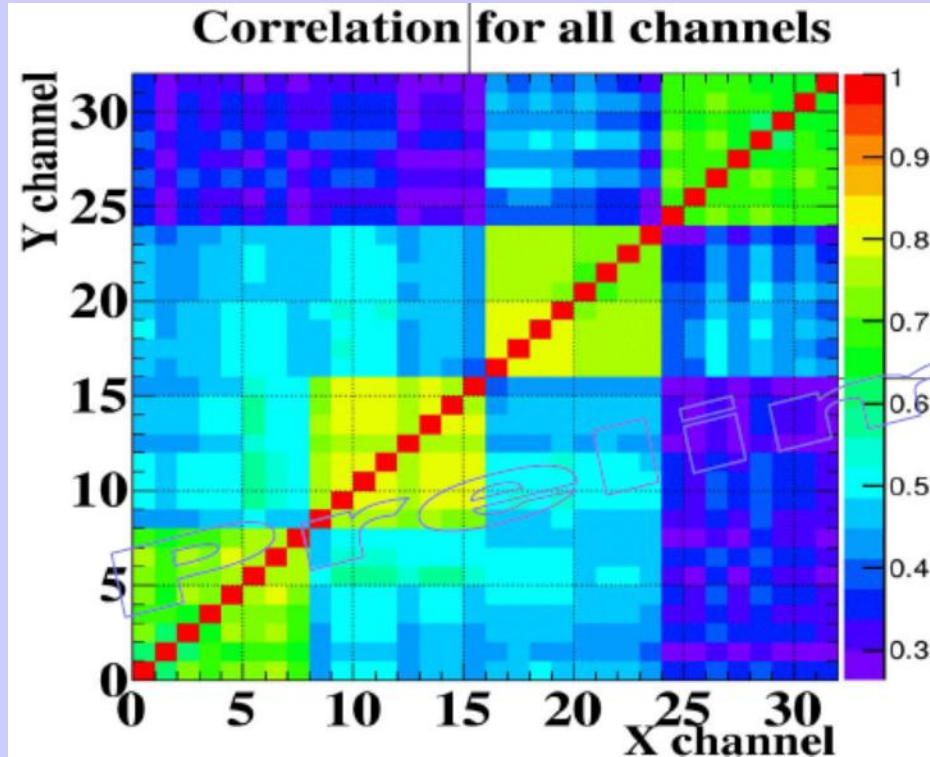

Signal as a function of the voltage, test beam (GaAs)

Signal as a function of the voltage, lab measurement

Multiparticle crossing

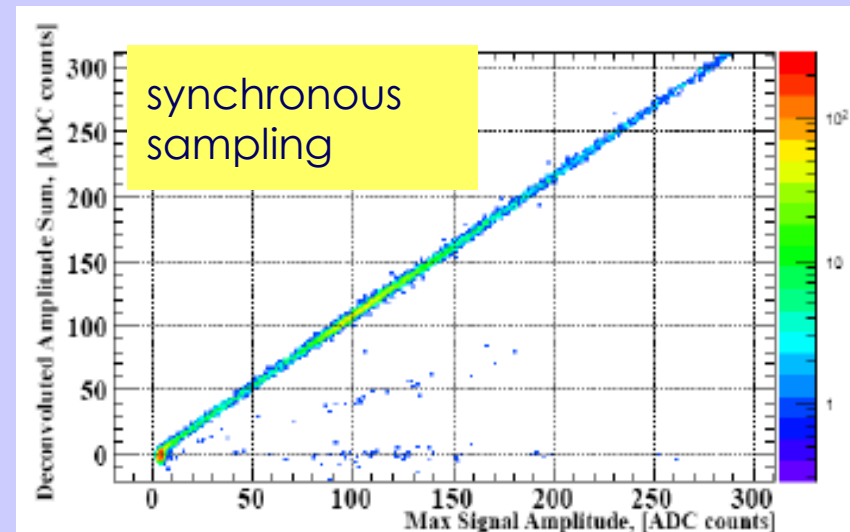

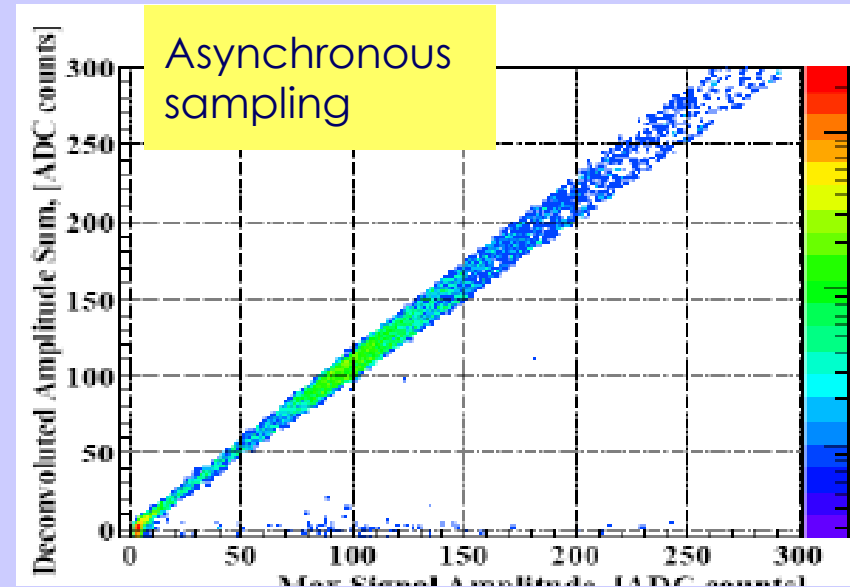

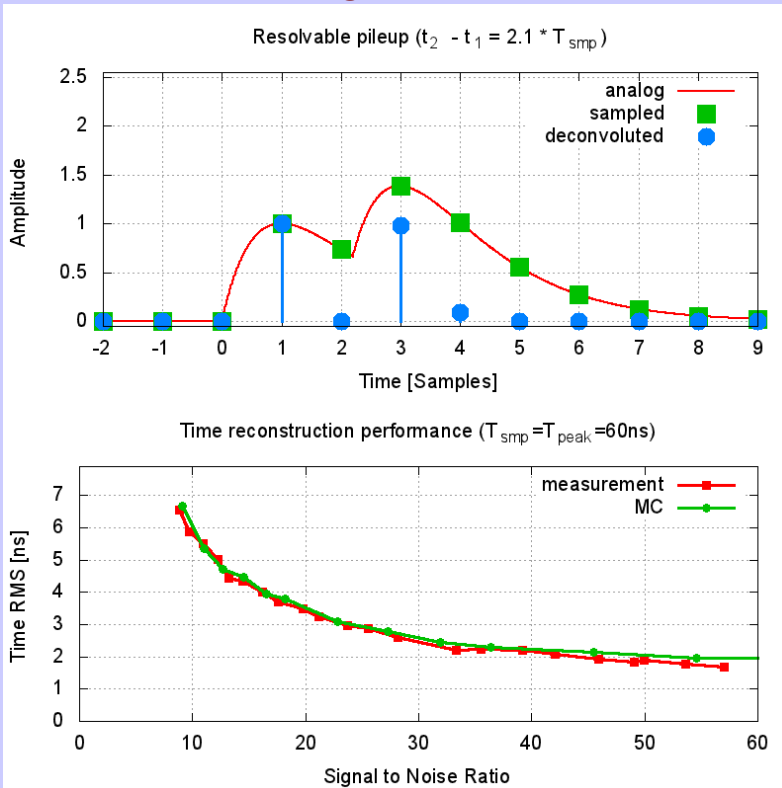

Common mode noise

Application of signal de-convolution

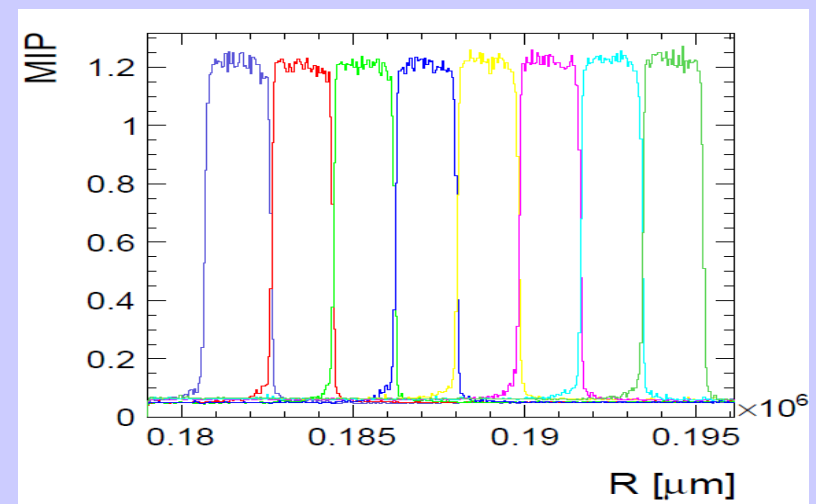

- Reduction of a long CR-RC pulse to 1 or 2 non-zero samples
- Pile-up resolving

Track reconstruction using the telescope

Signal amplitude on neighbour and between pads

Reconstruction of the 2 D shower shape

Under development – calorimeter prototype

- 30 sensor layers and tungsten planes
- Precise positioning ($50\ \mu\text{m}$) of sensor and absorber planes, very small clearance (compact calorimeter)

ADC ASIC prototype (130 nm IBM)

- 8 channels 10 bit SAR ADC
- Fully differential
- Sampling frequency 40 MHz

& DAQ matching AIDA standard

- After detailed design studies, sensors, FE and ADC ASICs are designed, tested and produced
- FE and ADC ASICs are attached to sensor prototypes (both BeamCal and LumiCal sensors) to form a fully operational sensor plane (32 channels connected)
- Performance studies are done in a test-beam
 - Stable operation with $S/N \sim 20$ (MIPs)
 - Small ($\sim 10\%$) loss of signal in the gaps
 - First estimate of a shower profile
- Ongoing work towards a prototype calorimeter with improved FE and ADC ASICs

Backup

Mechanical Frame

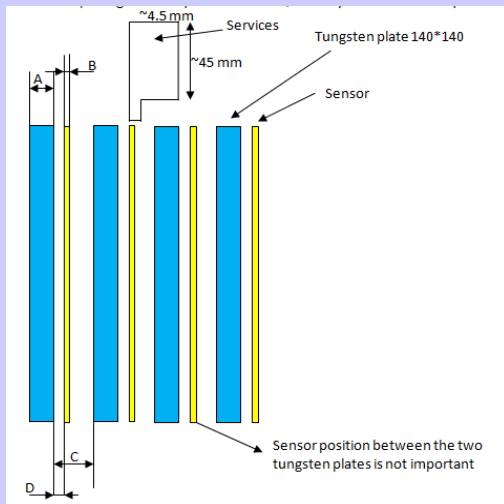

First machined permaglass frame

tungsten absorber plate inserted

Sensor plane

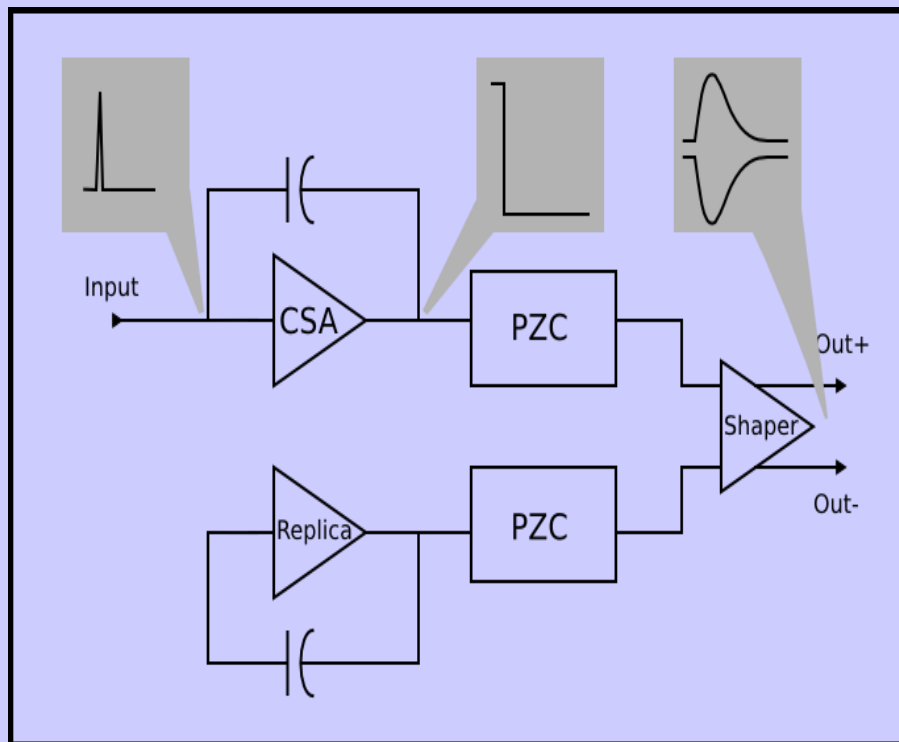

October 24, 2012

LCWS Arlington

Future ASICs will be designed and produced in 130 nm IBM technology (AGH-UST Cracow)
 faster, lower power consumption, radiation hard

- 10 bit SAR ADC (submitted in February 2012)
 - 1-2 mW at 40 Ms/s
 - 150 μm pitch
- new FE ASIC, improved ADC (submission in May)
 - Charge sensitive, PZC
 - Gain 0.15mV/fC and 15 mV/fC (switchable)
 - Peaking time 25-100 ns variable
 - 2 mW/channel
- Multichannel version in 2013

CLIC Electronics (proposal)

Triggerless time and amplitude reconstruction using asynchronous deconvolution or a gated integrator

With a peaking time of 60 ns and $S/N = 20$ a time resolution Of $< 2ns$ was obtained (simulation and test with dedicated hardware).

More detailed physics background simulations needed!

Alignment Concept (INPAS Cracow)

- Reference for position monitoring QD0
- Laser beams and sensors between QD0 and LumiCal
- Laser beams between both LumiCal

DAQ (INP and TAU)

- Follows the ILD standard (Calice, LCTPC)
- 4 Detector Interface units are ordered
- 1 Link Data Aggregator under test
- Concept not yet finished

Radiation Damage Study Facility (Santa Cruz)

will allow performing radiation hardness studies under more realistic conditions, e.g. considering also the hadronic component in electromagnetic showers;

Design studies, background, systematic effects for 500 GeV advanced

Published in JINST

Systematics of luminosity measurement at 500GeV

Source	Value	Uncertainty	Luminosity Uncertainty
σ_θ	2.2×10^{-2} [mrad]	100%	1.6×10^{-4}
$\Delta\theta$	3.2×10^{-3} [mrad]	100%	1.6×10^{-4}
a_{res}	0.21	15%	10^{-4}
luminosity spectrum			10^{-3}
bunch sizes σ_x, σ_z	655 nm, 300 μ m	5%	1.5×10^{-3}
two photon events	2.3×10^{-3}	40%	0.9×10^{-3}
energy scale	400 MeV	100%	10^{-3}
polarisation, e^-, e^+	0.8, 0.6	0.0025	1.9×10^{-4}
total uncertainty			2.3×10^{-3}

* 100%= Upper limit – the size of effect is taken as uncertainty

Design studies, background, systematic effects, readout electronic for 500 GeV advanced

- Cylindrical sensor-tungsten sandwich calorimeter
- Small Moliere radius
- Finely segments
- FE ASICs positioned at the outer radius

Design of the forward region of a CLIC detector

Crossing angle 20 mrad

- BeamCal angular coverage 10 – 40 mrad
- LumiCal coverage 38 - 110 mrad
- 40 X_0 depth
- Optimised to minimise backscattered particles

Vorward Region Design, ILD

Forward Region Design, ILD

AGH-UST Cracow Readout board, 32 channels

- AMS 350 nm
- 20 Ms/s ADC
- External and self trigger
- Internal or 'beam' clock
- Data transfer via USB
- Power pulsing
- Handshaking with Trigger Logic Unit (TLU)
- Used in several beam-test ventures

4 pairs of front-end+ADC ASICs

Data concentrator
Xilinx Spartan 3E
